14	**Abstract**	In the Kharif season of 2024, Haryana Space Applications Centre (HARSAC) implemented the Semi-Physical Model for paddy yield estimation in alignment with the YES-TECH guidelines outlined in the manual. The model leverages a comprehensive understanding of the biochemical processes underlying plant-light absorption for photosynthesis, radiation use efficiency, stress factors, accumulated biomass, and grain yield. The strength of the Semi-Physical Model lies in its adoption of a process-based framework with limited parameterization, making it a recognized and superior alternative to simple empirical modeling methods. The fine scale model was found to be effective in estimating yield at	

		insurance unit scale (IU) which is the gram panchayat in Haryana. This End-season report summarizes the results of crop acreage estimates for cluster-1, cluster-2 and cluster-3 districts of Haryana using time-series NDVI data from Sentinel-2 and unsupervised classification technique. The district-wise sowing dates generally fall between July and September, reflecting typical agricultural practices. Paddy cultivation shows good health, as indicated by NDVI values ranging from 0.3 to 0.7 depicting stages from sowing to harvest. The independent validation of the rice crop mask was carried out by SAC as MITR, and the observations for most districts showed overall classification accuracies ranging from 83.9% to 97%. Biomass ranges between 3500 Kg/ha to 14000 Kg/ha in the paddy regions of Haryana. The majority of biomass range was found within the range of 5000 Kg/ha to 10000 Kg/ha. Modelled yield of insurance units (IUs) for the current year was calculated using semi-physical model at village level showing the range between 2500 Kg/ha to 4000 Kg/ha. Comparison between estimated and observed yield (data from CCEs, n=51) for the current year at village level showed encouraging results with the coefficient of determination of 0.7668 and RMSE of 418.70 Kg/ha. Yeild estimates of Majority of IUs (4611 out of 5252) falls under the guidelines of YES-TECH. ***Key words:*** *Semi-physical model**,** Paddy, yield and health, satellite data, NDVI, Haryana.*

Executive Summary

The End of Season Report seeks to comprehensively evaluate and document the implementation of the YES-TECH project under the Pradhan Mantri Fasal Bima Yojana (PMFBY) in Haryana. In collaboration with the Agriculture Department of the Government of Haryana and SAC, ISRO (as MITR), Haryana Space Applications Centre (HARSAC) plays a pivotal role as the Technology Implementation Partner (TIP).

The report is structured with precision across various chapters, each contributing uniquely to the understanding of the project's methodology, data utilization, results, and discussions. The Introduction sets the context by emphasizing the global significance of crop insurance as a crucial risk management tool in the face of frequent and substantial crop losses. The integration of technology, including remote sensing, mobile, and data analytics, within PMFBY is highlighted, paving the way for the introduction of the YES-TECH initiative.

The core methodology, detailed in Chapter 4, encompasses a holistic approach, from ground data and satellite data utilization to smart sampling, CCE data collection, yield modelling, and accuracy evaluation. The systematic integration of various technological interventions, such as satellite-based crop mapping, weather data analysis, and the use of semi-physical models, forms the crux of YES-TECH's success. The report emphasizes the value of YES-TECH in enhancing precision and efficiency in agricultural practices by synthesizing ground and satellite data and integrating CCE data.

For the upcoming Kharif season in 2024, HARSAC has strategically chosen to implement a Semi-Physical Model, aligning with YES-TECH guidelines. The innovative approach of blending 70% reliance on CCE estimates with 30% on the Semi-Physical Model ensures a balanced and thorough calculation of crop insurance, minimizing biases and disputes while promoting informed decision-making.

In conclusion, this End of Season Report stands as a crucial tool for stakeholders, decision-makers, and partners involved in the YES-TECH project. It not only offers a detailed account of methodologies but also provides valuable insights into the impact of technology-driven strategies on crop insurance and precision farming. As a testament to both success and challenges, the report sets the stage for ongoing collaboration, dialogue, and advancement of agricultural technologies, ultimately benefiting the farming community and the state of Haryana as a whole.

1. Introduction

Agriculture is exposed to numerous hazards causing frequent and huge crop losses all over the world. As a result, crop insurance has become a crucial risk management tool. One of the best strategies to approach the issues of food security, income security, and climate resilience is to build a rich system of crop insurance to minimize the impact of covariate risks in agriculture.

The Pradhan Mantri Fasal Bima Yojana (PMFBY) is a crop insurance scheme in India aimed at tackling agricultural risks. It incorporates technology like remote sensing, mobile, and data analytics for effective implementation. Over the past years DA&FW engaged with various tech agencies to explore technologies like remote sensing data, UAVs, simulation models, AI/ML, and other for accurate yield estimation at the smallest administrative unit, the Gram Panchayat. Based on the results YES-TECH initiative was introduced, to promote cohesive use of modelled and CCE yield estimates for insurance claim assessment.

The objective behind YES-TECH includes providing results from pilot studies, published models by agencies like Space Applications Centre (SAC), ISRO and National Remote Sensing Centre (NRSC), ISRO, (Tripathy et. al., 2014; Murthy et al., 2021; Tripathy et. al., 2021) and increasing its acceptance by states. A large-scale incorporation of technology-based solutions has been conceptualized by DA&FW to integrate the system for technology-based yield-estimation and crop damage assessment under YES-TECH i.e., Yield Estimation System based on Technology, under the Pradhan Mantri Fasal Bima Yojana. YES-TECH promotes the combined use of CCE yield-estimates and modelled estimates for insurance claims using crop health photos taken at defined intervals and the Collection of Real-time Observations & Photographs of Crops (CROPIC) initiative. Additionally, a network of Automatic Weather Stations (AWS) and Automatic Rain Gauges (ARG) will be established under the Weather Information and Network Data System (WINDS) to provide accurate weather data.

At present, crop yield estimation is determined by carrying out CCEs. The limited number of measurements leads to higher errors in estimates and their susceptibility to subjectivity emerges as a significant limitation in obtaining dependable yield estimates. As a result, the estimated crop yield of an Insurance unit has tendency to exhibit bias which leads to disputes and delays in claims settlement. In order to reduce the biasness technological interventions can be used. By implementing these technology-based factors in the form of using satellite data long-term weather datasets, and usage of mobile apps for CCEs and collecting crop pictures, crop yield estimation and crop damage assessment can be improved. These technology-based estimations are unbiased and when used in combination with CCE estimates, they can improve the quality and results of the crop yield estimation.

Recommended models for crop yield estimation as per YES-TECH implementation framework are as follows:

- Semi-physical model

- AI/ML models
- Crop simulation models
- Ensemble models (AI / Crop Simulation / Semi-physical etc.,)
- Parametric index of crop performance (Indirect approach)

The general framework of model implementation is presented in Figure 1. Satellite-based crop mapping, satellite and weather data analysis for generating crop health indicators, field data collection and analysis, yield modelling, and insurance loss assessment are important tasks in this framework.

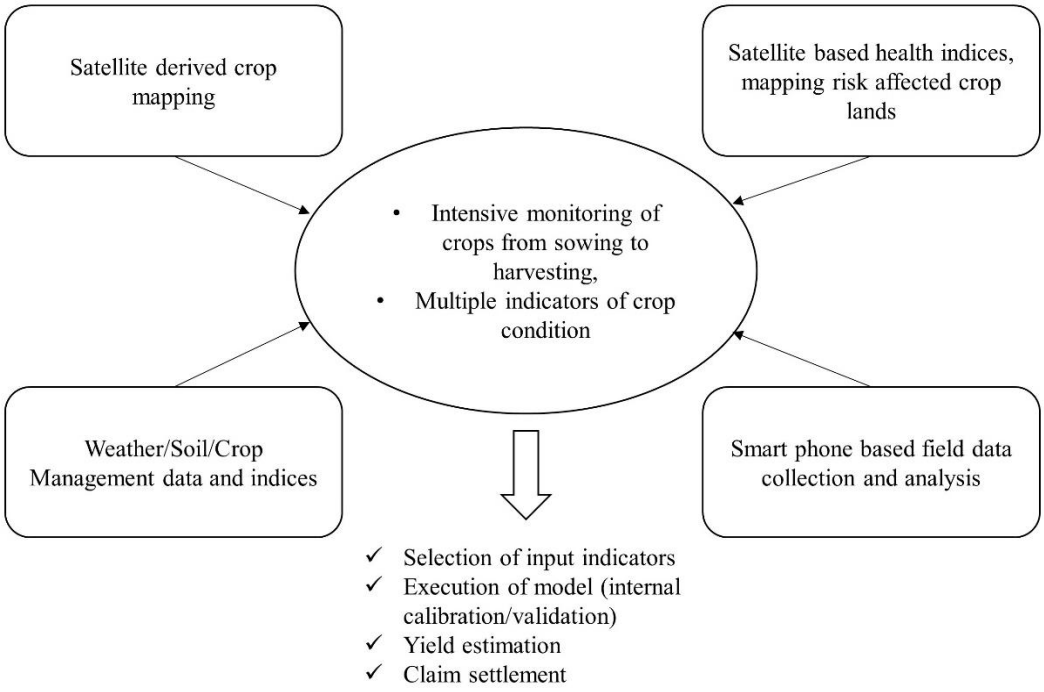

Figure 1: General framework of data analysis.

For the upcoming Kharif season in 2024, HARSAC has chosen to utilize a Semi-Physical Model for crop yield estimation as part of the YES-TECH implementation in Haryana. According to YES-TECH guidelines, the process of determining crop insurance coverage will encompass a comprehensive evaluation, with 70% of the assessment relying on estimates generated from Crop Cutting Experiments (CCEs), while the remaining 30% will be based on estimates derived from the Semi-Physical Model. This approach ensures a balanced and thorough calculation of crop insurance, incorporating both methodologies to arrive at a robust and well-informed decision. In 2023-24, the implementation of the YESTECH semi-physical model for rice and wheat crops yielded promising results i.e. 70% to 99% Insurance Unites showed deviation between technology yield and DOA yield within 30% limit as suggested in YES-TECH Manual Guideline. HARSAC worked in close collaboration with government bodies, MITR, Department of agriculture, and local farmers, ensuring a holistic approach to the implementation of YESTECH. Their role in disseminating knowledge and sharing insights on the benefits of space technology in agriculture contributed to the overall success of the project. Government

is now willing to use technology yield on 100 percent basis for all the crops in Haryana which itself shows the success of YES-TECH implementation and indicates that the initiative is well-aligned with its objectives.

Projects under taken by HARSAC

- Time Series mapping of Rabi and Kharif crops at cadastral level using Field, satellite and Smart Geo-enable tools.
- Smart Sampling Technique applications for CCEs of Haryana Agriculture Department.
- Block level Yield assessment under SUFALAM project in collaboration with SAC.
- Crop Production Forecasting under Forecasting Agricultural output using Space, Agro-meteorology and Land based observations (FASAL) Scheme (for Paddy, Cotton, Sugarcane, Wheat and Mustard).
- NASA ISRO Synthetic Aperture Radar (NISAR) mission for crop biophysical parameters.
- Potato and Citrus Mapping under Coordinated Horticulture Assessment and Management using geo-informatics (CHAMAN) project.
- Retrieval of algorithm for high resolution soil moisture assessment in collaboration with SAC.

2. Study Area

For optimum implementation of all the processes under YES-TECH, the state of Haryana has been divided into three clusters (each comprising of 7 districts each) in accordance with the decision taken by Sate Level Coordination Committee on Crop Insurance (SLCCCI). The cluster wise districts are as follows and also shown in Figure 2.

- Cluster I: Faridabad, Kaithal, Kurukshetra, Panchkula, Rewari, Rohtak, Sirsa.
- Cluster II: Ambala, Gurgaon, Hisar, Jind, Karnal, Mahendragarh, Sonipat.
- Cluster III: Bhiwani, Charkhi Dadri, Fatehabad, Jhajjar, Mewat, Palwal, Panipat, Yamunanagar.

Note: The above details of the districts in clusters are as per the Notice No. 1626-Agri.II(1)-2023/5890 dated 25th July, 2023.

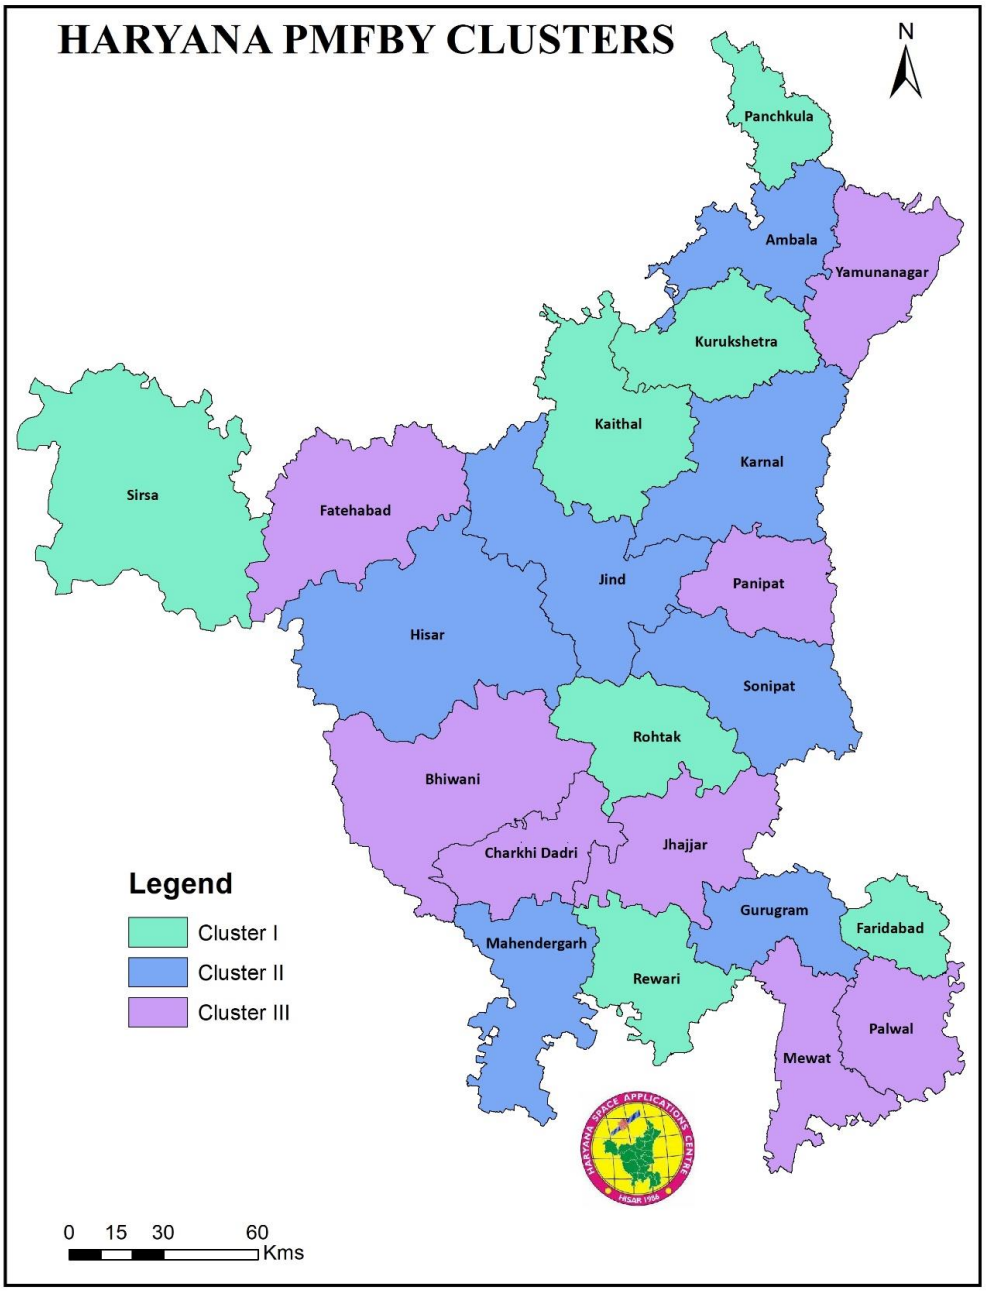

Figure 2: Cluster-wise representation of Districts, Haryana under YES-TECH, PMFBY.

3. Data Used

3.1. Ground Data

In all 22 districts of Haryana, field staff were employed under this project during the 2024 kharif season to acquire crop-related field data. The staff acquired the ground truth data inventory of the Paddy Crop, the spatial distribution of which is shown in Figure 3.

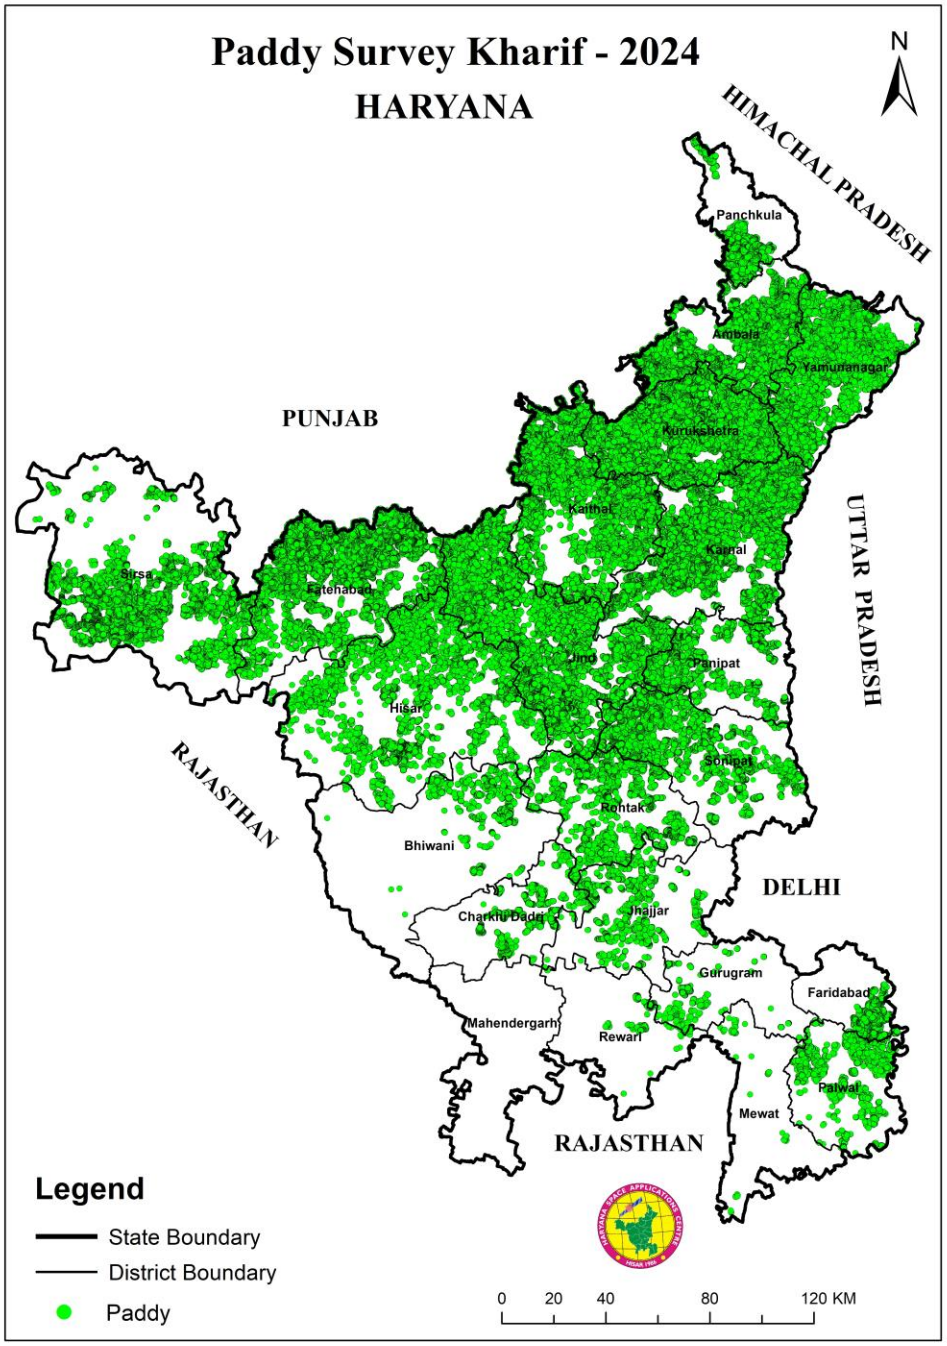

Figure 3. Spatial Distribution of Paddy Survey across Haryana in Kharif 2024.

3.2. Satellite Data

For the classification and crop mask generation, Sentinel-2 satellite data from both the A and B platforms, offering a 5-day revisit capacity, was obtained in the form of the Surface Reflectance product (S2MSI2A) from the European Space Agency's website (https://scihub.copernicus.eu/dhus/#/home). This product encompasses surface reflectance information, along with geometrically corrected and radiometrically enhanced data. Table 1 provides the district wise description with number of scenes and dates used.

Table 1: Description of Satellite Data with number of scenes and dates used for classification.

District Name	Selected Date for Classification (DD-MM-YYYY)	Tile ID
Ambala	15-09-2024,31-09-2024	43RFP/RGP
Bhiwani	31-08-2024,15-09-2024, 05-10-2024	43RFM/REM

A generic description of the datasets used by HARSAC for Yield estimation using Semi-Physical model is listed in Table 2.

Table 2: Datasets Used by HARSAC for Yield Estimation using Semi-Physical Model.

Parameter	Dataset Used	Resolution
Daily Integrated Insolation	INSAT 3DR/IMAGER 3RIMG Processing Level: L3, Version 01R00. 3RIMG_L3C_INS_DLY, MOSDAC (https://mosdac.gov.in).	4000m
fAPAR (fraction of absorbed Photosynthetically Active Radiation) for developing relationship between NDVI and fAPAR	Terra/MODIS-MOD15A2H	500 m
L1C reflectance from S2 is for rice mask	Sentinel-2 MSI	10m
NDVI product for Crop Transplanting Date retrieval	Terra/MODIS-MOD13A1	500m
Maximum Radiation Use Efficiency (RUEmax)	From Literature, as based on the major cultivar for different district.	Literature
Harvest Index (HI)	Past CCE yield for HI	Insurance Unit (IU)
Crop Duration	Duration in days (120 or so)	District

4. Methodology

4.1. Field Data Collection

Following methodology (Figure 4) had been used to create a comprehensive database of ground surface features, including land cover information and crop inventory data, for satellite image classification analysis.

1. **Ground Truth Data Collection and Crop Inventory:**
    - Conducted extensive *G-Fasal* (Mobile application-based) field surveys at the village level across all districts of Haryana to gather ground truth data.
    - Collected information on various elements on landscape of Haryana such as water bodies, built-up areas, crops, forest and wastelands along with crop inventory data.
    - Captured visual representations of the crops.
- **Tools:** Utilized a GPS and an Android-based cloud application equipped with geofencing capabilities.

2. **Integration of Databases:**

- Merge the collected ground truth data from field surveys with any pre-existing datasets.
- Ensure seamless integration of spatial and temporal data.
- Store the integrated data in a geodatabase for subsequent analysis.

3. **Training Sample Generation for Paddy Classification:**

- Utilize the integrated geodatabase to extract training samples based on crop areas.
- Organize the training samples in a format suitable crop discrimination and classification.

Above methodology ensured the creation of a robust database for satellite image classification and crop monitoring, providing accurate and up-to-date information for various applications.

4.2. Satellite Data Processing for crop map and area

4.2.1. Sentinel-2 Satellite Data Pre-Processing:

- Cloud-free Sentinel-2 images were obtained from the European Space Agency (ESA) website.
- ERDAS Imagine and Arc Pro software were utilized for image processing, including the following steps:
  - Selection of suitable VNIR bands.
  - Mosaicking of multiple images to create a seamless composite.
  - Extraction of an Area of Interest (AOI) layer for focused analysis.
  - Generation of False Colour Composite (FCC) images for visual interpretation.
  - Creation of time-series Normalized Difference Vegetation Index (NDVI) images for monitoring vegetation changes over time.

This comprehensive methodology allowed for the preparation and enhancement of Sentinel-2 satellite data, enabling accurate crop acreage estimation in the study area.

4.2.2. Preparation of Non-Crop Area/Mask

Following methodology was opted to create non-crop mask which can be further used for better classification of the crop type for acreage estimation:

- To identify non-crop areas, a detailed digitisation at village level using high resolution satellite imagery (sentinel-2 cloud free data) is performed for each district.
- This digitization incorporated various categories such as built-up areas, water bodies, road networks, forests, plantations, grassland, wastelands, and barren lands, to improve accuracy.
- The accuracy of the mask was validated by ground truth data and Google Earth Pro.
- All the non-agriculture classes were merged into a single class of “non-crop area”.

- This mask was subsequently utilized to mask out non-agriculture area to reduce the mixing of crop classes with other land use features.

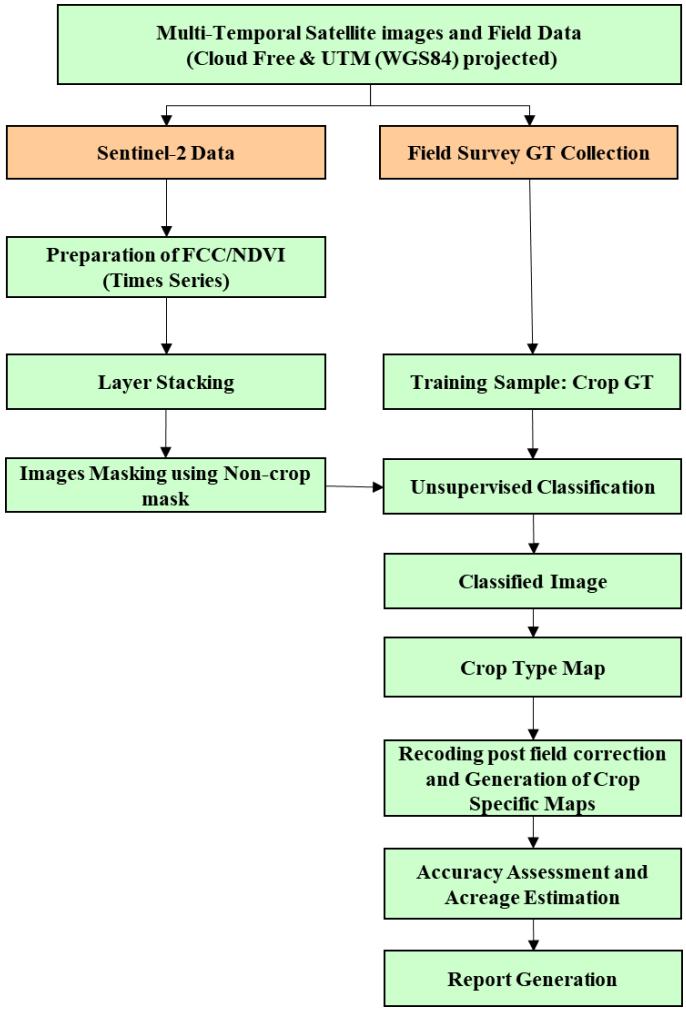

Figure 4: Flow-chart of methodology followed for pre-processing and classification of satellite data for extracting crop pattern map.

4.2.3. Crop Classification

1. Unsupervised Classification:

- The K-means and Iterative Self-Organizing Data Analysis Technique (ISO-DATA) classifiers to the stack of images using ERDAS Imagine or Arc GIS Pro software.
- The unsupervised classification method with object-based classification type and ISO Cluster classification algorithm was used to classify paddy and other crop in area of interest.
- Record the resulting 'n' classes (typically 250-300) and assign them to crop types based on ground truth data and spectral signature in ERDAS software.
- In Arc pro a classification schema with various crop classes i.e. Paddy, Bajra, Sugarcane, cotton etc., was used to organize all the features in imagery into distinct

classes. The level of importance given to the spectral differences of features and the proximity between features in imagery was set to 20. The minimum segment size was considered as 5 pixels i.e. 0.6178 acres that resulted in merging of segments smaller than this size with their best fitting neighbour segment although the minimum mappable unit for Sentinel 2 data is <1 hectare but to capture the individual fields of ~ 1 acre this criterion was selected.

- Perform classification either on single-date data or time-series NDVI stacked data.

4.2.4. Crop Acreage Estimation

1. **Classification and Accuracy Assessment**:
    - Following classification, an accuracy assessment of the crop type/pattern map is conducted using independent GT datasets (points) and paddy crop mask.
    - SAC team as MITR also performed the accuracy assessment of Paddy mask using independent GT data collected by SAC team.
2. **Crop Area Estimation**:
    - Crop area estimation is performed using the District, Tehsil, and Village boundaries of the state for the areas >300 m^2.
    - Within each administrative unit (up to village), crop area calculations in '000 ha are carried out using geometric tools.
    - Crop areas are summarized by crop name.
    - Aggregated crop area data is compiled at the state level.

The methodology involved classification, and cross-validation, followed by the estimation of crop areas at various administrative levels using district boundaries, Tehsil boundaries, and Village boundaries.

4.3. Smart Sampling and CCE Data Collection

The location for performing the CCEs using smart sampling approach are generated collaboratively by MNCFC and HARSAC. These locations are then forwarded to the Department of Agriculture for a combined use in CCE data collection. Subsequently, the collected CCE data by HARSAC, was utilised for further analysis and validation. This integrated dataset plays a crucial role in both Yield modeling and validation processes. Since the agriculture department, compile CCEs data late, they may be used for the further analysis and validation of data obtained in the current exercise at later stage.

4.4. Yield Modelling

The project's primary aim is to develop a comprehensive yield modelling system for Paddy (Kharif season) in Haryana. The model framework (flowchart) furnished in Figure 5 represents the methodology for crop yield estimation using semi physical model.

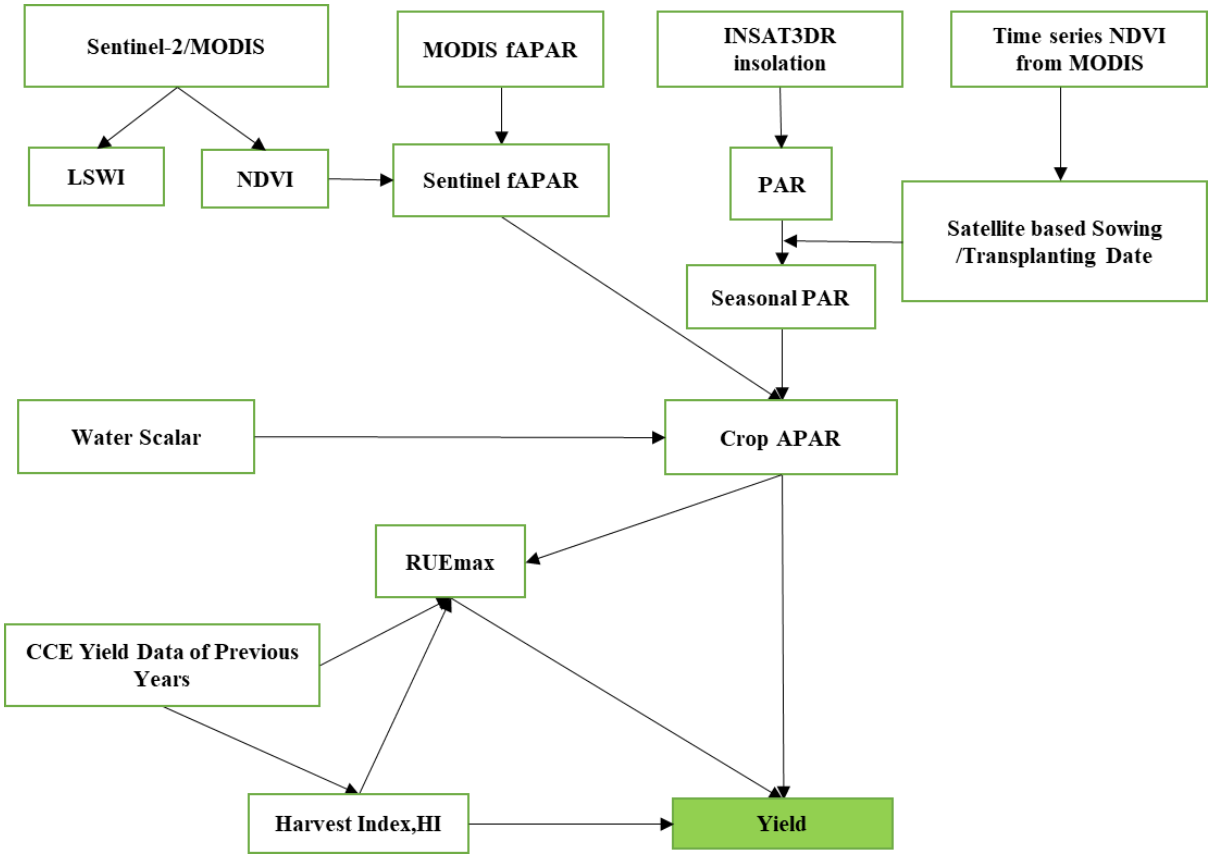

Figure 5: Methodology for Crop Yield Estimation using Semi physical approach.

Basic Input Data for the semi-physical model are, Fraction of absorbed photo synthetically active radiation (fAPAR), Photo synthetically active radiation (PAR), maximum Radiation Use efficiency (RUEmax), Water Scalar, and Harvest Index (HI). These can be classified into raw data and derivatives as follows:

- **Raw data**
  - ❖ Sentinel 2/MODIS surface reflectance
  - ❖ MODIS fAPAR
  - ❖ MODIS NDVI
  - ❖ INSAT 3DR daily Insolation
- **Derivatives**
  - ❖ Satellite derived Crop Map
  - ❖ Sowing date
  - ❖ Photosynthetically Active Radiation (PAR)
    - $PAR = Daily\ Surface\ Insolation * 0.48$
  - ❖ Fine resolution fAPAR
  - ❖ fAPAR (10m) = m*Sentinel NDVI (10m) + c

    m is the slope of the linear regression equation and c is the intercept.

- ❖ Water Scalar using LSWI
  - $LSWI = \frac{Band2-Band6}{Band2+Band6}$ (for MODIS)

    $LSWI = \frac{Band8A-Band11}{Band8A+Band11}$ (for Sentinel 2)
  - $W_{Scalar} = \frac{1+LSWI}{1+LSWI_{max}}$
- ❖ Crop Biomass Estimation
  - Biomass $= RUE_{max} \sum_{Sowing}^{Harvest} (\text{PAR} * \text{FAPAR} * W_s)$
- ❖ Crop Yield estimation
  - $Yield = Biomass * Harvest\ Index\ (HI)$
  - $HI = Economic\ Yield / Biological\ Yield$

Following is the detailed methodology for the Yield Modelling:

A. Crop Mask Preparation:

- Utilized satellite imagery and remote sensing techniques (un-supervised classification approach) to create district-wise crop masks.
- Incorporated data from various sources for precise crop type classification.
- Post field corrections
- Final crop mask was prepared

B. Data Collection and processing from relevant sources:

- Daily Integrated Insolation
- fAPAR (Fraction of Absorbed Photosynthetically Active Radiation)
- LSWI and maximum LSWI for estimating Water Scalar
- Maximum Radiation Use Efficiency (RUEmax) for Paddy

C. Crop Cutting Experiments (CCEs):

- The CCEs was executed combinedly with the agriculture department and IUs.
- Random checking of CCEs by HARSAC team in collaboration with Agriculture Department Haryana.
- Utilize CCEs data for Harvest Index (HI) for Paddy crop.

D. Bias Correction between INSAT 3D and INSAT 3DR:

We model the relationship between INSAT 3DR and INSAT 3D values by using Linear Regression approach. Linear Regression aims to find a linear relationship between two variables. Here the two variables are INSAT 3DR (Independent variable) and INSAT 3D (Dependent variable) (Figure 6).

General form of linear regression equation is:

$$y = mx + c$$

Where:

- y is predicted INSAT-3D value (dependent variable).
- x is the INSAT-3DR value (Independent variable).
- m is the slope of the line.
- c is the intercept.

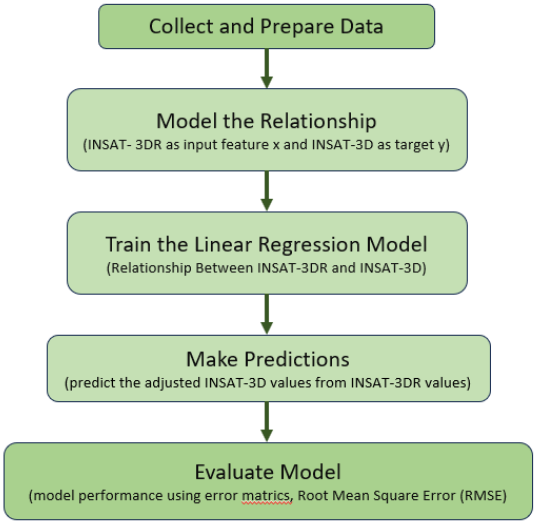

Figure 6: Flow-chart of methodology for bias correction between INSAT-3D and INSAT-3DR.

E. Yield Estimation:

- The yield was estimated using variables like showing and harvesting dates, PAR data, fAPAR, Water Scaler, and Harvest Index (HI).
- To estimate the transplanting date, time-series MODIS NDVI, was downloaded spanning 30 days prior to start of normal growing season and covering the entire transplanting period. ISODATA classification was performed on the mask out crop NDVI raster data (stack layer of sowing period) and 10 classes were made. Further, the mean time-series NDVI values for each class was estimated. Using polynomial 4^{th} order, the temporal NDVI curve plot of each class was fitted and a modelled matrix had been created showing the modelled NDVI time-series. The fitted NDVI time-series values were further subtracted from the original NDVI time-series values. The resulted subtraction matrix was further analysed to assess spectral emergence which is basically the matrix values having magnitude of >0.02 in a particular row, depicting the transplanting date.
- Integrate the collected data and HI parameter to establish a comprehensive yield estimation model.
- Analyse time series data for accurate predictions.
- Validation of Estimated Yield using Observed Yield (from CCEs).

4.5. Accuracy Evaluation

Root Mean Square Error (RMSE)- The RMSE describes the sample differences between the predicted and observed values. Each of these differences is known as residuals when the calculations are done over the data sample that was used to estimate and known as prediction errors when calculated out of sample. The RMSE aggregates the magnitudes of the errors in predicting different times into a single measure of predictive power. It is used as a measure of comparing different models and is expressed as:

$$RMSE = \left[\left\{\frac{1}{n}\sum_{i=1}^{n}(O_i - E_i)^{2}\right\}\right]^{\frac{1}{2}}$$

where, n is the number of years for which prediction has been made, O_i and E_i are the observed and predicted values, respectively.

Mean Absolute Percentage Error (MAPE)-: Mean absolute percentage error is an evaluation metric used to measure the accuracy of predictions across industries, such as in finance and economic forecasts. MAPE is often used as the loss function in regression problems and forecasting models due to the intuitive interpretation in terms of relative error for evaluation also known as the mean absolute percentage deviation (MAPD), MAPE is defined as the average absolute percentage difference between predicted values and actual values.

The mean absolute percentage error measures the accuracy of a fitted models and the formula is given as

$$MAPE = \frac{100}{n} \times \sum_{i=1}^{n}\left|\frac{o_i - E_i}{o_i}\right|$$

Where, O_i and E_i are the observed and forecasted values, n is the number of years for which forecasting has been done.

Normalized Root Mean Square Error (NRMSE) -: It is a function that allows the user to calculate the Normalized Root Mean Square Error (NRMSE) as absolute value between predicted and observed values using different type of normalization methods. Root Mean Square Error (RMSE) can be used to compare different models. However, RMSE doesn't perform well if comparing models fits for different response variables or if the response variable is standardized, log-transformed, or otherwise modified. To overcome these issues, the NRMSE is used instead Root mean square error. Lower NRMSE values indicate the less variance for a model. However, the normalized root mean square error

is not always reliable for finding the best model, especially for small samples. The normalized root mean squared error (NRMSE), also called a *scatter index*, is a statistical error indicator defined as:

$$NRMSE = \frac{\sum(S_i - O_i)^2}{\sum O_i^2}$$

Where, O_i is the observed values and S_i are simulated values.

CORRELATION COEFFICIENT - In a bivariate distribution if the change in one variable appears to be accompanied by a change in the other variable and vice-versa then the variables are said to be correlated. The term correlation is mutual relationship between two or more variables. If for an increase (decrease) in the variable X, variable Y also shows increase (decrease) accordingly, the correlation will be positive. If the increase (decrease) in X, is accompanied by a corresponding decrease (increase) in variable Y, then the correlation will be negative. If change in one variable does not show a change in the other variable, the two variables are called uncorrelated or independent.

Methods of Measuring Correlation:

(i) Scatter diagram

(ii) Karl Pearson coefficient of correlation

For the current work Karl Pearson coefficient of correlation has been used.

Karl Pearson Coefficient of Correlation or Product Moment Correlation Coefficient or Simple Correlation Coefficient:

It is a mathematical method for measuring the degree or strength of linear relationship between two variables and was suggested by Karl Pearson (1901). The Pearson coefficient of correlation between X and Y is denoted by the symbol r_{xy} or simply 'r' and is defined as the ratio of covariance between X and Y to the product of the standard deviations of X and Y.

$$r = \frac{Cov(X,Y)}{\sqrt{V(X)}\sqrt{V(Y)}}$$

A simplified formula for computation of correlation coefficient is:

$$\boldsymbol{r} = \frac{\sum XiYi - (\sum Xi)(\sum Yi)/n}{\sqrt{(\sum X_i^2 - (\sum X_i)^2/n)(\sum Y_i^2 - (\sum Y_i)^2/n)}}$$

Properties:

i) It is a unit less number i.e. independent of the units of measurement.

ii) The correlation coefficient always lies between -1 & +1 i.e. $-1 \leq r \leq 1$.

iii) The coefficient of correlation is independent of change of scale and shift of origin of the variables X and Y.

iv) If two variables are independent, their correlation coefficient is zero, but the converse is not true. It is because correlation coefficient measures only linear type of relationship, thus even if it is zero, the variables may have a non-linear relationship.

v) The degree of relationship between two variables is symmetrical i.e. $r_{yx} = r_{xy}$

Example 1: A random sample of two variables shows the quantity of variable one (i.e. x) and and variable 2 (i.e. y) in different years as:

x:	30	29	36	72	37	36	51	48	37	50	51	36
y:	27	20	34	67	35	37	50	46	36	42	46	35

Then the coefficient of simple correlation between these two variables and its signifance can be assessed as:

Solution- n = 12, Sx = 513, Sy = 475 $Sx^2 = 23557$, $Sy^2 = 20385$ and Sxy = 21861

$$\boldsymbol{r} = \frac{\sum XiYi - (\sum Xi)(\sum Yi)/n}{\sqrt{(\sum X_i^2 - (\sum X_i)^2/n)(\sum Y_i^2 - (\sum Y_i)^2/n)}}$$

r = 0.969

H_0: r = 0 (quantity in these two variables are independent)

H_1: r_1= 0 (Two tailed test)

t cal = $\frac{r\sqrt{n-2}}{\sqrt{1-r^2}}$ = $\frac{0.969\times\sqrt{10}}{\sqrt{1-0.939}}$ =12.4

Since $|t_{cal}|$ > table t-value (2.228) at 10 df and $\alpha = 0.05$, therefore, we conclude that the variable one has a high positive correlation with the variable two.

T -TEST

The large sample theory was based on the application of Normal deviate test. However, if sample size n is small (n<30), Normal deviate test cannot be applied if n is small. Hence to deal with small samples, new techniques and tests of significance known as exact sample tests were developed which were pioneered by W. S. Gosset (1908) who wrote under the pen name of Student and later on developed and extended by Professor R. A. Fisher (1926). From practical point of view, a sample is small if its size is

less than 30. we shall discuss Students t-test. In exact sample tests, the basic assumption is that the population(s) from which sample(s) are drawn is (are) normal i.e., the parent population(s) is (are) normally distributed and sample(s) is (are) random and independent of each other. The exact sample tests can be used even for large samples, but large sample theory cannot be used for small samples. T -test is an inferential statistic used to determine if there is a significant difference between the means of two groups and how they are related. T-tests are used when the data sets follow a normal distribution and have unknown variances. The *t*-test's most common application is to test whether the means of two populations are different. Let X_i (i=1, 2…, n) be a random sample of size n drawn from a normal population with mean μ and variance σ^2, then student's t is defined by the statistic.

$$t = \frac{\bar{X} - \mu}{S/\sqrt{n}}$$

Where,

$$\bar{X} = \frac{1}{n}\sum_{i=1}^{n} X_i \ , \quad S^2 = \frac{1}{n-1}\sum_{i=1}^{n}(X_i - \bar{X})^2$$

where S^2 is an unbiased estimate of the population variance σ^2, and it follows student's t distribution with (n-1) degrees of freedom. Therefore (n-1) S^2=n s^2

The follows student's t distribution with (n-1) degrees of freedom. If calculated |t| > tabulated value of t at 5 percent level of significance viz., $t_{0.05}$; (n-1) d.f. then H_o is rejected at 5 per cent level of significance which implies that there is a significant difference between sample mean and population mean or the sample has not been drawn from the population having specified mean = μ_0. If calculated |t| < tabulated value of t at 5 percent level of significance viz., $t_{0.05}$; (n-1) d.f. then H_o is accepted.

Applications of t-test

i) t-test for significance of single mean, population variance being unknown.
ii) t-test for the significance of the difference between two means, the population variances being equal.
iii) t-test for significance of an observed sample correlation coefficient.

Index of Agreement

The index of agreement is the ratio of the mean square error and the potential error (PE) multiplied by N (no. of observation) and then subtracted from one (Willmott, 1984). The index of agreement varies from 0 to 1 with higher index values indicating that the modelled values Pi have better agreement with the observations, Oi. Although the index of agreement provides some improvement over the coefficient of determination, it is still sensitive to extreme values due to the square differences in the mean square error in the numerator. Application of the index of agreement shows that the relatively high values of d

may be obtained even for a poor model fit (Willmott, 1984). The presence of outliers in the dataset may lead to relatively higher values of d due to the squaring of the difference term (Willmott, 1981). In order to overcome this limitation, Legates and McCabe Jr (1999) introduced a modified index of agreement followed by a generic form of index of agreement proposed by Willmott (1984) and this is defined as:

$$d = 1 - \frac{\sum_{i=1}^{n}(O_i - P_i)^2}{\sum_{i=1}^{n}(|P_i - \bar{o}| + |o_i - \bar{o}|)^2} \quad 0 \leq d \leq 1$$

where O_i is the observation value and P_i is the forecast value and O bar is the average observation values.

5. Results and Discussion

5.1. Description of Field Data

Ground data were collected through geofenced mobile app. *G-fasal* for the classification and validation. A total of 214521 samples were collected in various districts. The district-wise sample distribution is provided in Table 3.

Table 3. District Wise Paddy Crop GT count for Kharif 2024.

Sr. No.	District	Paddy GT
1	Ambala	17421
2	Bhiwani	803
3	Charkhi Dadri	615
4	Faridabad	1590
5	Fatehabad	20802
6	Gurgaon	10597
7	Hisar	26622
8	Jhajjar	1825
9	Jind	19111
10	Kaithal	11905

15	Palwal	2635
16	Panchkula	10777
17	Panipat	4705
18	Rewari	13302
19	Rohtak	28979
20	Sirsa	18058
21	Sonipat	6868
22	Yamunanagar	22500
Total		**214521**

SAC team has conducted GT during 15th to 18th October 2024 in nine (9) districts of Haryana viz. Ambala, Jind, Kaithal, Karnal, Kurukshetra, Panchkula, Panipat, Sonipat and Yamunanagar. Field polygons were collected for the crops grown with rice during Kharif 2024. A total of 526 polygons for different crops were marked.

5.2 Bias Correction Between INSAT 3D and INSAT 3DR

The scatter plots showing relationship between monthly insolation from INSAT 3D vs INSAT 3DR shown is presented in Table 4. The Coefficient of determination (R2) showed a very good agreement with values ranging from 0.8 to 0.98. The best correlation was obtained during October while the worst during July. This analysis resulted in to the correction of bias between INSAT 3D insolation and INSAT 3DR insolation.

Table 4. Month Wise INSAT 3D vs INSAT 3DR Scatter Plot.

June		**y = 0.9215x + 10.609** **R² = 0.90**
July		**y = 0.6949x + 95.879** **R² = 0.80**
August		**y = 0.9555x + 21.626** **R² = 0.95**

September		**y = 1.0098x - 6.5055** **R² = 0.87**
October		**y = 0.9714x + 10.933** **R² = 0.98**

5.3. Crop Area Estimations

The total paddy acreage in Haryana was estimated to be 1528.48 thousand hectares. The district-wise acreage of the paddy crop is detailed in Table 5. Clusters are delineated by colours and presented just below the table. The paddy maps for Cluster-I districts, Cluster-II districts, and Cluster-III districts are depicted in Figure 7, Figure 8 and Figure 9 respectively. Maps Overall accuracy ranged from 86% to 99%. The accuracy of paddy crop mapping showed a variable range due to various reasons such as crop homogeneity, small farm size, high diversity of crops, mixing of spectrally similar crops, and coverage of the crop with respect to total geographical area of a region. The lower accuracy was obtained mainly for the southern districts exhibit all these characterize. Therefore, enlisting of associated crops, at district level have been provided at Table 6. The separability analysis (Jeffries–Matusita (JM) distance) showed results where the spectrally similar crops are having less separability Table 7. Cluster-wise and district-wise accuracies are outlined in Table 8, Table 9 and Table 10 respectively, for Cluster-I, Cluster-II, and Cluster-III. State level crop mapping accuracy is provided at Table 11.

Independent validation of crop mask generated by HARSAC using the GT collected by SAC as MITR

SAC team has conducted GT during 15th to 18th October 2024 in nine (9) districts of Haryana viz. Ambala, Jind, Kaithal, Karnal, Kurukshetra, Panchkula, Panipat, Sonipat and Yamunanagar. Field polygons were collected for the crops grown with rice during Kharif 2024. A total of 526 polygons for different crops were marked. An independent validation of rice crop mask was carried out for the rice crop mask generated by HARSAC team. Following observations were made:

- For most of the districts overall accuracies and kappa coefficient were higher than 85% and 0.65 respectively.
- The highest overall accuracy of 95.9% was observed Yamunanagar district with Kappa coefficient of 0.90 followed by Kaithal with and overall accuracy of 96.2% and Kappa coefficient of 0.73.
- The lowest accuracy was observed in Panchkula district (overall accuracy= 83.9% and Kappa coefficient=0.67).
- The User's accuracy varied between 89.3% to 98.3% while Producer's accuracy ranged between 82.8% to 96.2%.
- The overall Kappa coefficient was observed between 0.66 to 0.90.

The detailed results have been provided in Table 12.

Table 12. Accuracy Matrics for different Districts.

District	User's Accuracy (%)	Producer's Accuracy (%)	Overall Accuracy (%)	Kappa coefficient
Ambala	95.4	92.3	92.6	0.84
Jind	98.3	94.1	94.7	0.87
Kaithal	98.2	96.2	95.2	0.73
Karnal	99.1	95.2	94.9	0.72
Kurukshetra	90.9	96.0	89.3	0.66
Panchkula	90.0	82.8	83.9	0.67
Panipat	89.8	90.9	89.8	0.79
Sonipat	89.3	91.9	88.0	0.74
Yamunanagar	97.1	90.2	95.9	0.90

5.4. Suitability of Smart Sampling (Stratification Efficiency)

The smart sampling procedure has been adopted for the collection of CCEs data. The sample locations were identified using crop health stratified data. It was observed that the Yield estimated had followed the crop health pattern (Figure 10) properly showing a good agreement and suitability of smart sampling

in the YES-TECH estimates where the CCEs are decided based on crop health pattern. The pattern has been obtained as a summation of NDVI during current crop season.

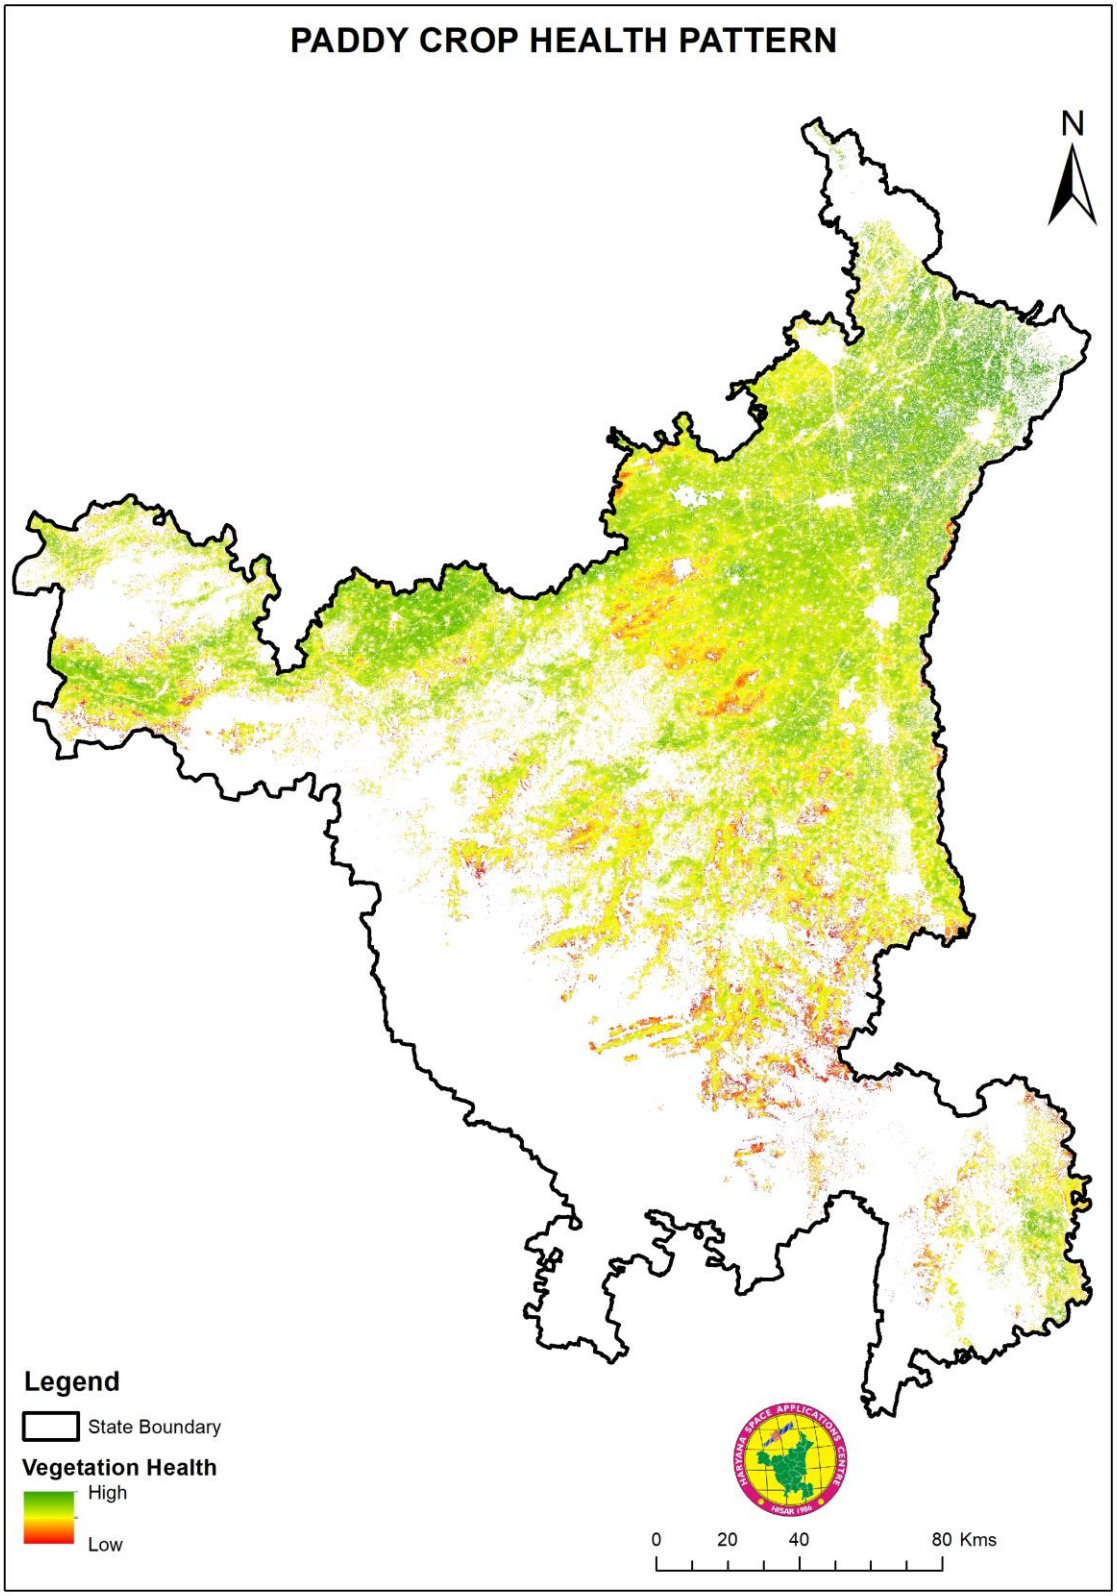

Figure 10. Vegetation Health Pattern for in Kharif 2024.

5.5. CCE data description

The standard procedure of CCEs have been followed to obtain ground data related to the Paddy yield. The HARSAC team visited along with the team of agriculture department Haryana and utilized G-fasal geofenced mobile app for the data collection. A total of 51 locations were selected for CCE, well distributed in various yield groups (Low, Medium, High) as per the suggested guidline of YES-TECH manual. Four locations at each village were selected for the experiment. The whole Paddy crop was harvested in a dimension of 5×5 meters plot and weighted using electronic weight. The minimum yield obtained was 1967 Kg/ha and maximum was 5764 Kg/ha from CCEs experiment on these sites.

5.6. Yield Estimation and its Evaluation

The yield was estimated using satellite-based data, including insolation, NDVI, LSWI, PAR, water scalar, and fAPAR following the methodology given in YESTECH manual with technical guidance from SAC for input parameter generation including the transplanting date, which is an important parameter for aggregating the biomass for the whole rice season. The primary inputs were similar to the suggested parameters in the YES-TECH manual. The temperature scaler has not been considered in the current assessment after the suggestions from MITR.

5.6.1 NDVI pattern

The NDVI for the paddy crop ranged from ≃0.1 to ≃0.7. The district-level time-series NDVI pattern followed the crop growth pattern from transplanting date to harvesting date obtained in the current study. The distribution of NDVI in all 22 districts of Haryana is presented in Figure 11, Figure 12 and Figure 13 for the three clusters viz. cluster I, cluster II, and cluster III respectively. The Panchkula district which falls under cluster I, gets peak growth during Mid-August to mid-September. Similarly, Kurukshetra district gets peak growth during the August. Faridabad district also showed similar pattern however, the cloud and haze affected the time-series curve abruptly. Kaithal district showed peak growth stage during August month. The paddy crop in Sirsa was mainly distributed in along the Canal and it gets peak growth during September. The NDVI values remain less than 0.7 in Sirsa. Rohtak District also showed peak growth during September first week with NDVI values less than 0.7. Very small area of Rewari have distribution of Paddy crop. The peak growth was obtained during August and September. Districts falls under cluster II including Ambala, Karnal, Sonipat, Hisar, Jind, and Gurugram showed peak growth during August, and September. Districts falls under cluster III including Yamunanagar, Fatehabad, Mewat Charkhi Dadri and Bhiwani showed Peak NDVI during September. Panipat, Palwal, and Jhajjar district of cluster III showed peak NDVI during August.

5.6.2 Transplanting date

The spatial pattern and distribution of transplanting dates were estimated for all 22 districts and are presented in Figure 14, Figure 15, and Figure 16 across the three clusters. Transplanting dates varied

from 161 Julian days (i.e., 19 June) to 210 Julian days (i.e., 28 July). Early transplanting dates (between 20th June to 25th June 2024) were observed in Ambala, Fatehabad, Panipat, Kurukshetra, and Sonipat, while late transplanting dates (between 5th July to 25th July 2024) were noted in Fatehabad, Kaithal, and Rewari districts. The occurrence of a late transplanting date of 210 Julian days (28th July) in these districts was attributed to flooding followed by resowing. The Julian days along with their calendar dates taken as transplanting dates for further calculations are presented in Table 13.

Table 13. District-wise Transplanting dates.

5.6.3 Water Scalar

Water scalar has been estimated using Sentinel-2 data. District-wise water-scalar maps in each cluster i.e. cluster-I, cluster-II, and cluster-III is presented in Figure 17, Figure 18, and Figure 19 respectively. The values of water scalar were ranging from 0.4 to 1 for the paddy crop. Most of the values were skewed towards higher ranges in all the districts which showed relatively low water stress in Haryana region. Higher values of water scalar during August, and September showed very less stress. The time-series values of water-scalar follow the pattern of plant growth where the higher values were obtained during August and September (peak growth season), while lower values of water scalar were found during June-July (crop planting season), and October (Ripening season).

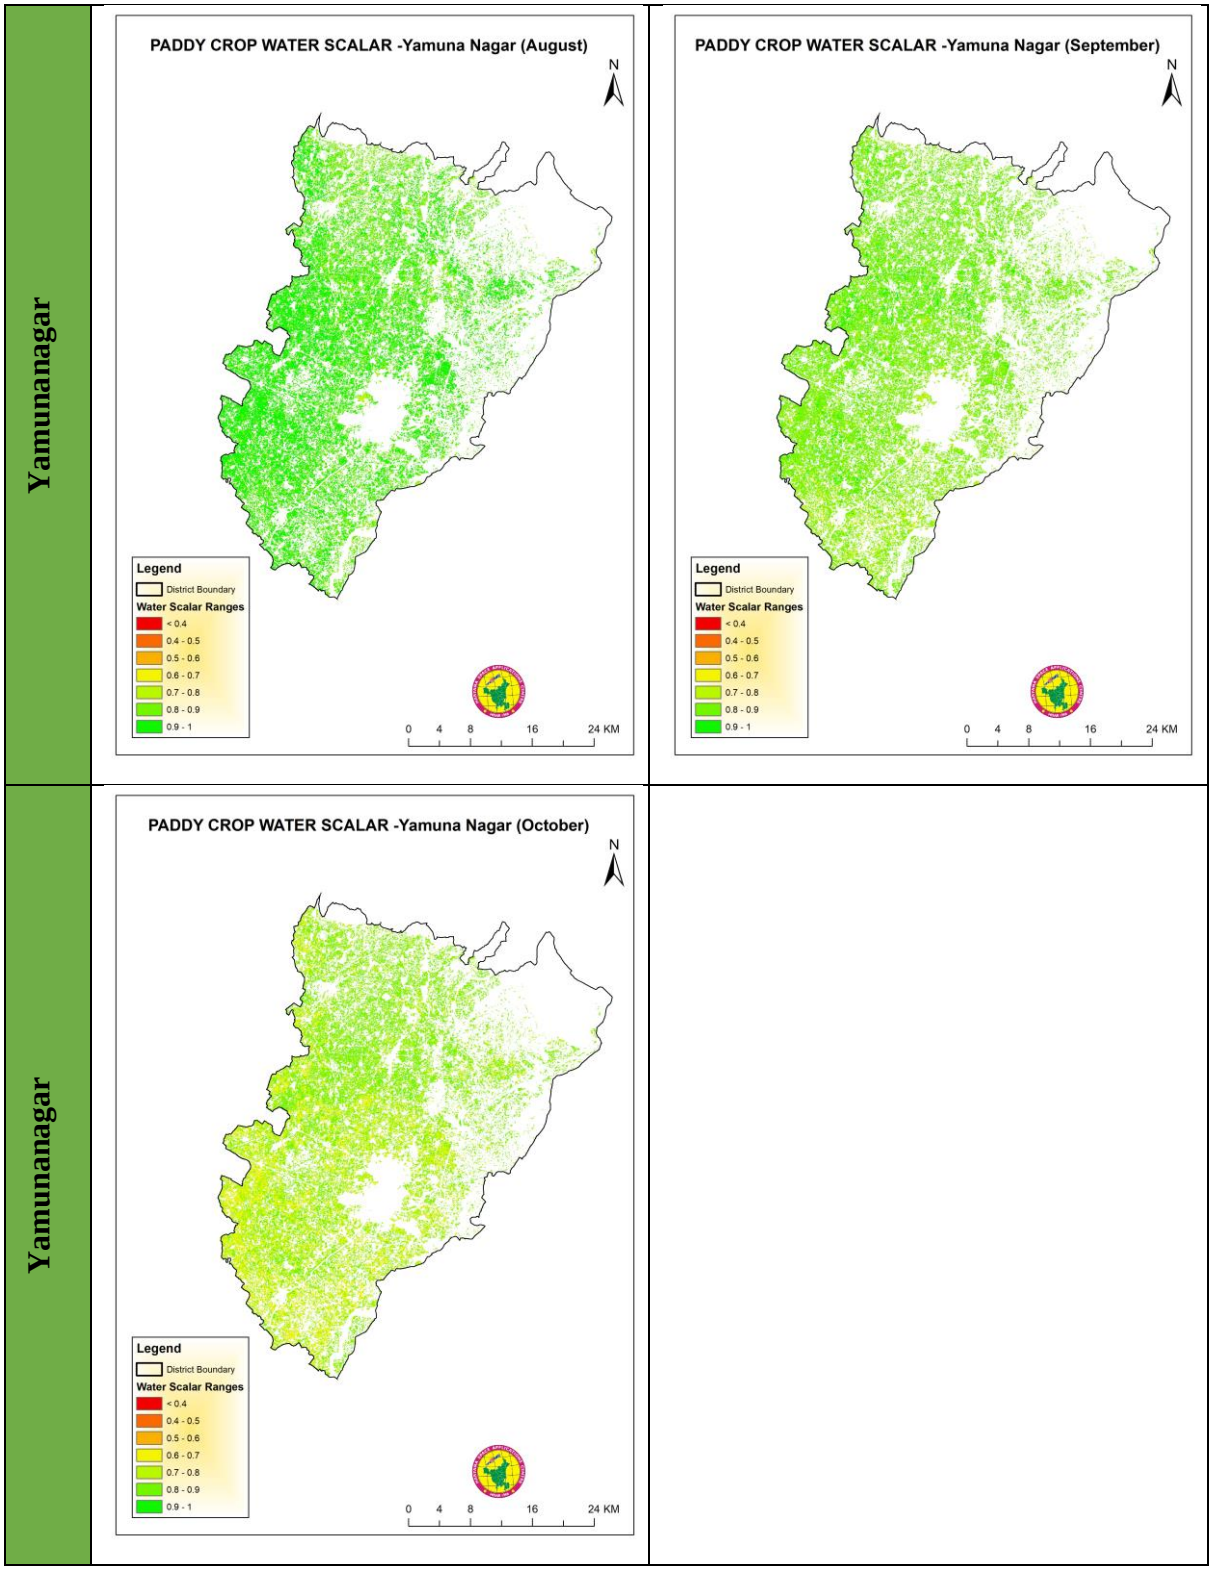

Figure 19: District-Wise Water Scalar Maps for Districts of Cluster III in Kharif 2024.

5.6.4 FAPAR Estimation

FAPAR was estimated for each district falling in cluster I, II, and III. The fAPAR values were ranging from 0.01 to 1. The NDVI obtained from sentinel-2 data was converted to the FAPAR using a linear model obtained from a relationship between MODIS-based FAPAR and Sentinel NDVI. Cluster-wise and district-wise scatter plot, linear model, and coefficient of determination is presented in Table 14:

Table 14. Cluster-wise, district-wise linear models used for FAPAR estimation.

Cluster-I

Panchkula		**y = 0.9873x + 0.0253** **R² = 0.94**
Kurukshetra		**y = 0.9994x + 0.0314** **R² = 0.82**
Faridabad		**y = 0.9486x + 0.0408** **R² = 0.91**

Kaithal		**y = 0.9993x + 0.0396** **R^2 = 0.82**

Charkhi Dadri		**y = 0.9185x + 0.0154** **R^2 = 0.84**

5.6.5 Photosynthetic Active Radiation (PAR)

PAR is the amount of solar radiation that is present for the photosynthetic process of the plants per unit area. Most of the districts in Haryana showed a total seasonal PAR in the range between 900 MJ to 1150 MJ. The district-wise spatial distribution of season sum of PAR is presented at Figure 20, Figure 21, and Figure 22 for cluster-I, cluster-II, and cluster-III respectively.

The PAR values in Faridabad and Sirsa (which a cluster-I district) are mostly falling in the range of 1051 MJ to 1100 MJ. The PAR values in Kaithal, Panchkula, Rewari, Rohtak, Kurukshetra (which is also a cluster-I district) are mostly falling in the range of 900 MJ to 1000 MJ. Some part also showed the PAR values upto and even >900 MJ (Figure 20).

The districts fall in cluster-II are Ambala, Gurugram, Hisar, Jind, Karnal, and Sonipat. The seasonal sum of PAR mainly ranges between 900 MJ to 1000 MJ for Gurugram, Jind, Karnal, and Ambala. Relatively higher values of PAR were obtained for Hisar and Sonipat district which falls mainly in the range of 1101 MJ to 1150 MJ (Figure 21).

The districts fall in cluster-III are Bhiwani, Charkhi Dadri, Fatehabad, Jhajjar, Mewat, Palwal, Panipat, and Yamunanagar. The seasonal sum of PAR ranges mainly between 900 MJ to 1050 MJ for Bhiwani, Charkhi Dadri, Fatehabad, Mewat, Palwal, and Yamunanagar. The PAR ranges between 1051 MJ to 1150 MJ for Jhajjar and Panipat districts (Figure 22).

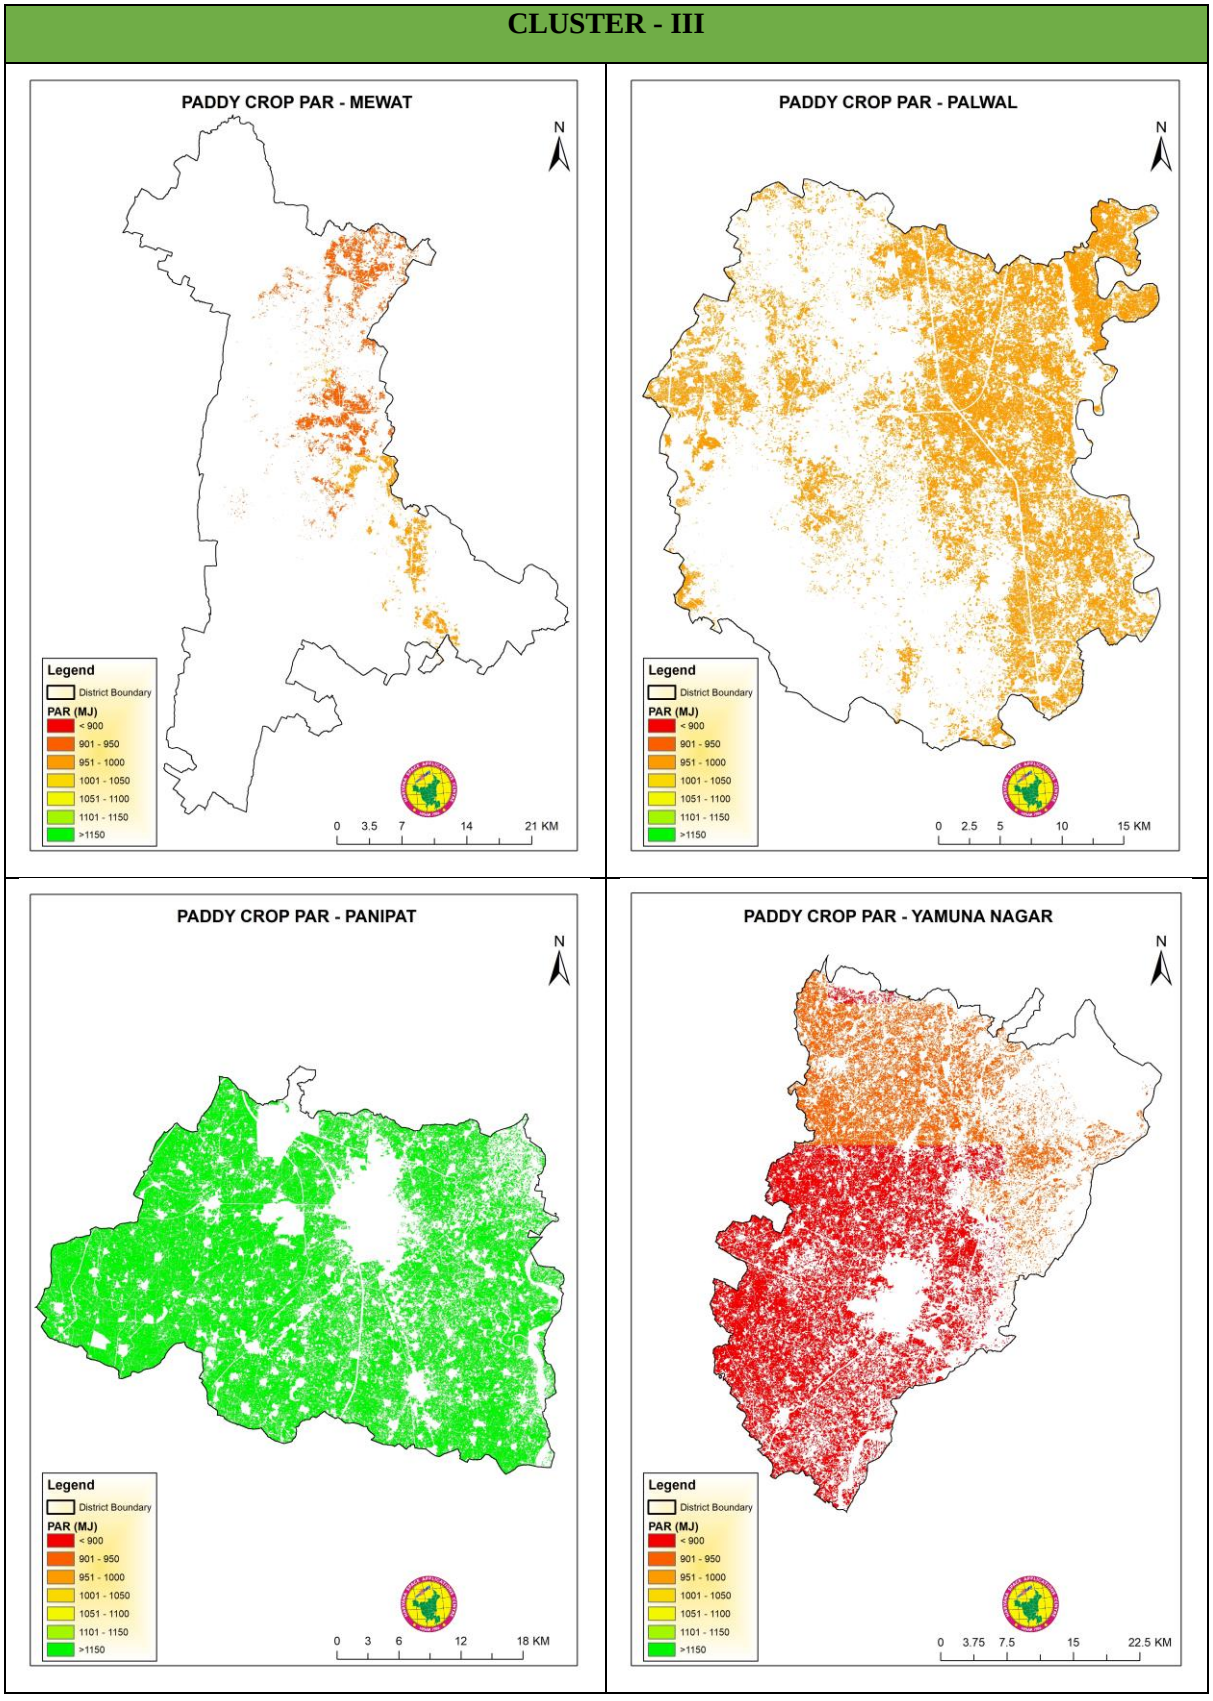

Figure 22: District Wise PAR Map of Paddy for Cluster III (Kharif 2024).

5.6.6 Absorbed Photosynthetic Active Radiation (APAR)

APAR is the product of PAR sum for a time period and FAPAR of the respective period (here month). Seasonal sum of APAR showed values between 100 MJ to 400 MJ and sometime more than 400 MJ also. The spatial distribution of district-wise APAR for the cluster-I, cluster-II, and cluster-III is presented at Figure 23, Figure 24, and Figure 25, respectively.

The APAR for the Faridabad district (cluster-I) falls mainly in the range of 200 MJ to 300 MJ. The APAR for Kaithal, Kurukshetra, and Panchkula (cluster-I) mainly falls between 200 MJ to >400 MJ. The APAR for the Faridabad Rohtak and Sirsa (cluster-I) district fall under the range of 200 MJ to 400 MJ (Figure 23).

Cluster-II have districts including Ambala, Gurugram, Hisar, Jind, Karnal, and Sonipat. The APAR values for Ambala, Karnal, and Sonipat was mainly falling between 200 MJ to 400 MJ, for Gurugram, Hisar and Jind if was falling between 100 MJ to 300 MJ (Figure 24).

The APAR for cluster-III districts (including Bhiwani, Charkhi Dadri, Fatehabad, Jhajjar, Mewat, Palwal, Panipat, and Yamunanagar) were also ranging from 100 MJ to >400 MJ. The dominant ranges for Bhiwani, Mewat, and Palwal were 100 MJ to 300 MJ. The dominant ranges for APAR in Charkhi Dadri, Fatehabad, Jhajjar, Panipat, and Yamunanagar districts were 200 MJ to 400 MJ (Figure 25).

5.6.7 Biomass

Biomass estimates were derived utilizing district-level layers following the guidelines outlined in the YES-TECH manual. The biomass ranged from 2500 Kg/ha to 12500 Kg/ha. The majority of biomass fell within the range of 5000 Kg/ha to 10000 Kg/ha. The central region of the state exhibited higher biomass values, whereas the southern parts demonstrated lower biomass levels. Some abrupt values were observed, attributed to scale variations in the input datasets. These values were excluded in the final yield assessment. Figure 26, Figure 27 and Figure 28 illustrates the district-wise distribution of biomass in each cluster.

5.6.8 Yield Estimation and Validation

The model estimated yield in the paddy pixel varied between 2500 Kg/ha to 5500 Kg/ha, with the central part of the state displaying relatively higher yield values. Detailed village-level yield information is provided in Annexure-1. The yield map of the state, at the village or insurance unit level, is illustrated in Figure 29. The yield data demonstrated strong agreement with ground data when compared to the previous year's information. The spatial distribution of biomass and yield in Haryana is depicted in Figure 29. Validation of predicted Yield (n=51) showed a very good correlation of 0.7668 with root mean square error (RMSE) of 419 Kg/ha. All other statistical parameters are presented in Table 15. Figure 30 is showing the validation plot for predicted and observed yield of Paddy in Haryana during Kharif 2024. Village-level yield map for each district falling in cluster-I, cluster-II, and cluster-III is presented in Figure 31, Figure 32 and Figure 33.

6. Summary and Conclusions

- Enlisted models in YES-TECH manual specifically semi-physical is one of the efficient models for Paddy yield estimation in Haryana.
- Satellite-based measurements have been found suitable for the paddy crop mapping at a spatial resolution of 10 meters. This season cloud free data was not available over many districts for a long period of time within the crop season and for that, we have prepared a strategy such as cloud masking, multi-temporal analysis, and the integration of alternative data sources to tackle the situation as suggested by MITR. Based-on that strategy such good agreement was observed between CCE and model estimated yield.

- NDVI pattern analysis showed progression of Crops in Sown area. The values for NDVI ranges between 0.1 to 0.7 during the crop growing period. The values were less during initial days of sowing, and near to the harvesting days and high during the peak growth time i.e. August-September in most of the paddy regions.
- Transplanting dates varied from 161 Julian days (i.e., 19 June) to 210 Julian days (i.e., 28 July).
- Water scalar values were ranging from 0.4 to 1 in the region. Most of the scalar values were found to be higher side showed relatively low water stress in the region.
- The FAPAR and NDVI showed high coefficient of determination (R^2) ranging between 0.81 to 0.96. FAPAR values were found to be in the range of 0.01 to 1.
- Most of the districts in Haryana showed a total seasonal PAR in the range between 900 MJ to 1100 MJ.
- Sum of APAR during paddy crop season showed values between 100 MJ to 400 MJ and sometime more than 400 MJ also.
- Biomass ranges between 2500 Kg/ha to 12500 Kg/ha in the paddy regions of Haryana. The majority of biomass range was found within the range of 5000 Kg/ha to 10000 Kg/ha.
- Modelled yield of insurance units (IUs) for the current year was calculated using semi-physical model at village level showing the range between 2500 Kg/ha to 4000 Kg/ha (**Anneure-1**). Comparison between estimated and observed yield (data from CCEs of 51 locations) for the current year at village level showed encouraging results with the coefficient of determination (r2) of 0.7668 and RMSE of 418.70 Kg/ha.
- The Yield data at IUs level is provided at Annexure-1 in a standard manner.
- The traditional CCEs along with soil and weather parameters has to be used for improving the yield estimates. At some of the IUs the deviation was higher which needs to be re-checked in up-coming years.
- The expected hazard of the project implementation is data unavailability. It has been seen that many a times data obtained through satellite measurements have cloudy conditions. This may create a significant error in the estimates. Thus, microwave data-based models may be developed for the yield estimation of crops taken under YES-TECH initiatives.
- The funding under the project is not soot lined. The authorities must understand the importance of funds for timely implementation of the project and must release the fund by changing fund release criteria of YES-TECH manual.

7. Comments and Recommendations of MITR, State and ICs

Comments from MITR	Action taken
In the introduction section, add few lines from the experience/success of YESTECH implementation during 2023-24 for rice and wheat crop using semi-physical model may also be included here.	Corrections incorporated
In the review literature section, YESTECH implementation reports of wheat also may be added	The reference is already present in the report. Thank you for the comment.
In the data section, in table 2, kindly change source of PAR as INSAT3DR; District wise details are not required, so table 3 may be omitted.	Corrections incorporated
In the Classification and crop mapping section, for separability analysis using JM distance, instead of keeping many classes for a crop (e.g. Paddy1, paddy2, cotton, cotton1) keep single class for each crop to have a better understanding about the separability or if any reason is there for keeping more classes that can be mentioned.	For separability analysis using JM distance, we are discriminating different crops therefore the representative paddy samples (paddy1, paddy2 etc.) and for samples of other crops has been taken hence no change has been made.
Classification accuracy carried out by SAC as MITR should be included in the report as suggested in MSR.	Corrections incorporated
Independent accuracy assessment by SAC as MITR should be included in the end season report.	Corrections incorporated
One paragraph on using INSAT3DR insolation data in place of INSAT3D data should be mentioned in the methodology. The month-wise scatterplots between INSAT3D and 3DR should be included in the result section with the bias equation and R2. This is the new data used for this season. So must be included to show the compatibility of the new data.	Corrections incorporated
In Photosynthetic Active Radiation (PAR) Add one paragraph for relationship of insolation from INSAT 3DR and INSAT 3D. this is new exercise for this season so must included.	We have added the methodology and results at appropriate place as suggested. If still requires improvement, need help from MITR side.
In FAPAR to NDVI relationship scatterplots mention the R2 correctly (rounding up to two decimal point). Correct the graphs as suggested in the PDF as	Corrections incorporated.

comments.	
Provide details of HI used with a map showing GP wise HI. Share the GP wise HI with SAC in excel.	Data Provided
Share annexure 1 (GP wise yield estimates from YESTECH as well as from DOA) in excel sheet with SAC.	Data Provided as per the requirement
Divide the GPs into three different groups- GPs with <20 RD%, with 20-30% deviation and with >30% deviation and share with SAC.	Data Provided as per the requirement
In the summary and conclusion section Paragraph 2 is contradictory to the real situation. This season cloud free data was not available over many districts for a long period within the crop season and for that, we have prepared a strategy to tackle the situation, and based on that strategy such good agreement was observed between CCE and model estimated yield. That should be reported.	Correction Incorporated
In the summary and conclusion section Bullet no 11 is not understood. What is meant by ready for loss assessment.	Thank you for your observations, Sentence is revised as loss assessment changed to claim settlement.
In the summary and conclusion section The statement under Bullet no 12 is based on which observation. The validation results showed very good agreement with the CCE yield.	Excel is provided for showing the observations.
Annexure 1- the values of yield may be rounded up to the nearest integer (whole no). Mention the source and reference for DOA yield.	As per Direction of DOA require values of yield up to two decimals.
Share the table in excel with information of DOA yield	The data is available in the ESR submitted. The same data is again provided as per the requirement
Figure 30- Mention n, no of CCE used for validation for R2.	Already provided in Table 15
