14	**Abstract**	In the Rabi season of 2023-2024, Haryana Space Applications Centre (HARSAC) strategically implemented a Semi-Physical Model for wheat yield estimation, aligning with YES-TECH guidelines.

		This model is developed by SAC for large area yield estimation with the inputs form satellite remote sensing (Tripathy et. al., 2014), which is based on the principles of monteith's efficiency model (Monteith, 1977). This model was modified for GP level yield estimation (Tripathy et al., 2022) and was implemented under YESTECH after being selected by the YESTECH committee based on the results from pilot studies. The model inputs are PAR, FAPAR, environment scalars (water and temperature), crop specific RUEmax and cultivar specific harvest index. In Haryana, wheat is the dominant crop, cultivated across all seven districts. The district-wise sowing dates generally fall between early November and mid-December, reflecting typical agricultural practices. Wheat cultivation shows robust health, as indicated by NDVI values ranging from 0.1 to 0.8, depicting stages from sowing to harvest. High accuracies (81% to 95%) in crop mapping, affirm reliable satellite data utilization. The current Rabi season generally maintains stable vegetation health, though deviations in NDVI are noted, possibly indicating stress factors like adverse weather. Overall, the district-specific NDVI profiles highlight healthy vegetation during the growth and maturity stages, supporting robust wheat cultivation across Haryana. Accordingly, the yield estimated ranged from 2183 Kg/ha to 5511 Kg/ha at Insurance Units (IUs) level and showed less deviation (99% IUs fall within the deviation range of <30%) as compared to the yield of earlier years. ***Key words:*** *Satellite Remote Sensing, Wheat, Yield, Semi-Physical model, NDVI, Rabi.*

Executive Summary

The End of Season Report seeks to comprehensively evaluate and document the implementation of the YES-TECH project under the Pradhan Mantri Fasal Bima Yojana (PMFBY) in Haryana. In collaboration with the Agriculture Department of the Government of Haryana and SAC, ISRO (as MITR), Haryana Space Applications Centre (HARSAC) plays a pivotal role as the Technology Implementation Partner (TIP).

The report is structured with precision across various chapters, each contributing uniquely to the understanding of the project's methodology, data utilization, results, and discussions. The Introduction sets the context by emphasizing the global significance of crop insurance as a crucial risk management tool in the face of frequent and substantial crop losses. The integration of technology, including remote sensing, mobile, and data analytics, within PMFBY is highlighted, paving the way for the introduction of the YES-TECH initiative.

The core methodology, detailed in Chapter 4, encompasses a holistic approach, from ground data and satellite data utilization to CCE data collection, yield modeling, and accuracy evaluation. The systematic integration of various technological interventions, such as satellite-based crop mapping, weather data analysis, and the use of satellite-based Semi-Physical Model (SPM), forms the crux of YES-TECH's success. The report emphasizes the value of YES-TECH in enhancing precision and efficiency in agricultural practices by synthesizing ground and satellite data and integrating CCE data.

The technology-based yield during the Kharif season 2023 for Paddy has been estimated successefully in past which provided a valuable insight on the performance of SPM. For the current Rabi season in 2023-24, HARSAC has strategically chosen to implement a remote sensing-based SPM, aligning with YES-TECH guidelines and a good experience from the past experience during Kharif 2023. The innovative approach of blending 70% reliance on CCE estimates with 30% on the remote sensing-based SPM ensures a balanced and thorough calculation of crop insurance, minimizing biases and disputes while promoting informed decision-making. The current experince shows a promising output which supports a blending hypothesis of 50-50% in near future.

In conclusion, this End Season Report stands as a crucial tool for stakeholders, decision-makers, and partners involved in the YES-TECH project. It not only offers a detailed account of methodologies but also provides valuable insights into the impact of technology-driven strategies on crop insurance and precision farming specifically at Insurance Unites (IUs) and will support the claim settlements. As a testament to both success and challenges, the report sets the stage for ongoing collaboration, dialogue, and advancement of agricultural technologies, ultimately benefiting the farming community and the state of Haryana as a whole.

1. Introduction

Agriculture is exposed to numerous hazards causing frequent and huge crop losses all over the world. As a result, crop insurance has become a crucial risk management tool. One of the best strategies to approach the issues of food security, income security, and climate resilience is to build a rich system of crop insurance to minimize the impact of covariate risks in agriculture.

The Pradhan Mantri Fasal Bima Yojana (PMFBY) is a crop insurance scheme in India aimed at tackling agricultural risks. It incorporates technology like remote sensing, mobile, and data analytics for effective implementation. Over the past years DA&FW engaged with various tech agencies to explore technologies like remote sensing data, UAVs, simulation models, AI/ML, and other for accurate yield estimation at the smallest administrative unit, the Gram Panchayat. Based on the results YES-TECH initiative was introduced, to promote cohesive use of modelled and CCE yield estimates for insurance claim assessment.

The objective behind YES-TECH includes providing results from pilot studies, published models by agencies like Space Applications Centre (SAC), ISRO and National Remote Sensing Centre (NRSC), ISRO, (Tripathy et. al., 2014; Murthy et al., 2021; Tripathy et. al., 2021) and increasing its acceptance by states. A large-scale incorporation of technology-based solutions has been conceptualized by DA&FW to integrate the system for technology-based yield-estimation and crop damage assessment under YES-TECH i.e., Yield Estimation System based on Technology, under the Pradhan Mantri Fasal Bima Yojana. YES-TECH promotes the combined use of CCE yield-estimates and modelled estimates for insurance claims using crop health photos taken at defined intervals and the Collection of Real-time Observations & Photographs of Crops (CROPIC) initiative. Additionally, a network of Automatic Weather Stations (AWS) and Automatic Rain Gauges (ARG) will be established under the Weather Information and Network Data System (WINDS) to provide accurate weather data.

At present, crop yield estimation is determined by carrying out CCEs. The limited number of measurements leads to higher errors in estimates and their susceptibility to subjectivity emerges as a significant limitation in obtaining dependable yield estimates. As a result, the estimated crop yield of an Insurance unit has tendency to exhibit bias which leads to disputes and delays in claims settlement. In order to reduce the biasness technological interventions can be used. By implementing these technology-based factors in the form of using satellite data long-term weather datasets, and usage of mobile apps for CCEs and collecting crop pictures, crop yield estimation and crop damage assessment can be improved. These technology-based estimations are unbiased and when used in combination with CCE estimates, they can improve the quality and results of the crop yield estimation.

Recommended models for crop yield estimation as per YES-TECH implementation framework are as follows:

- Semi-physical model

- AI/ML models
- Crop simulation models
- Ensemble models (AI / Crop Simulation / Semi-physical etc.,)
- Parametric index of crop performance (Indirect approach)

The general framework of model implementation is presented in Figure 1. Satellite-based crop mapping, satellite and weather data analysis for generating crop health indicators, field data collection and analysis, yield modelling, and insurance loss assessment are important tasks in this framework.

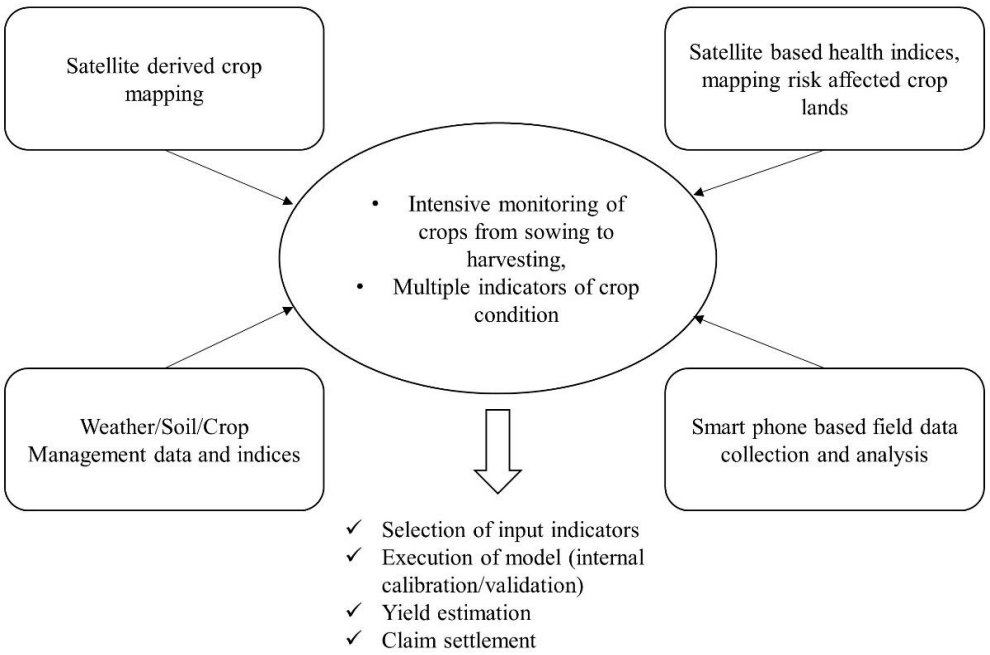

Figure 1: General framework of data analysis

Based on experience from Kharif season 2023 for Paddy crop, HARSAC has chosen the satellite-based Semi-Physical Model (SPM) has been utilized during the Rabi season in 2023 for crop yield estimation as part of the YES-TECH implementation in Haryana. According to YES-TECH guidelines, the process of determining crop insurance coverage will encompass a comprehensive evaluation, with 70% of the assessment relying on estimates generated from Crop Cutting Experiments (CCEs), while the remaining 30% will be based on estimates derived from the Semi-Physical Model. This approach ensures a balanced and thorough calculation of crop insurance, incorporating both methodologies to arrive at a robust and well-informed decision.

Projects under taken by HARSAC

- Time Series mapping of Rabi and Rabi crops at cadastral level using Field, satellite and Smart Geo-enable tools.
- Smart Sampling Technique applications for CCEs of Haryana Agriculture Department.
- Block level Yield assessment under SUFALAM project in collaboration with SAC.
- Crop Production Forecasting under Forecasting Agricultural output using Space, Agro-meteorology and Land based observations (FASAL) Scheme (for Wheat, Cotton, Sugarcane, Wheat and Mustard).
- NASA ISRO Synthetic Aperture Radar (NISAR) mission for crop biophysical parameters.
- Potato and Citrus Mapping under Coordinated Horticulture Assessment and Management using geo-iNformatics (CHAMAN) project.
- Retrieval of algorithm for high resolution soil moisture assessment in collaboration with SAC.

2. Study Area

For optimum implementation of all the processes under YES-TECH, the state of Haryana has been divided into three clusters (each comprising of 7 districts each) in accordance with the decision taken by Sate Level Coordination Committee on Crop Insurance (SLCCCI). The cluster wise districts (No. of IUs) are as follows and also shown in Figure 2.

- Cluster I: Panchkula (180), Kurukshetra (421), Faridabad (173), Kaithal (289), Sirsa (337), Rohtak (150), Rewari (421).

- Cluster II: Ambala (504), Karnal (447), Sonipat (356), Hisar (288), Jind (312), Mahendragarh (380), Gurugram (268).
- Cluster III: Yamunanagar (661), Panipat (200), Palwal (291), Bhiwani (286), Fatehabad (251), Jhajjar (271), Mewat (453), Charkhi Dadri (176).

Note: The above details of the districts in clusters is as per the Notice No. 1626-Agri.II(1)-2023/5890 dated 25th July, 2023.

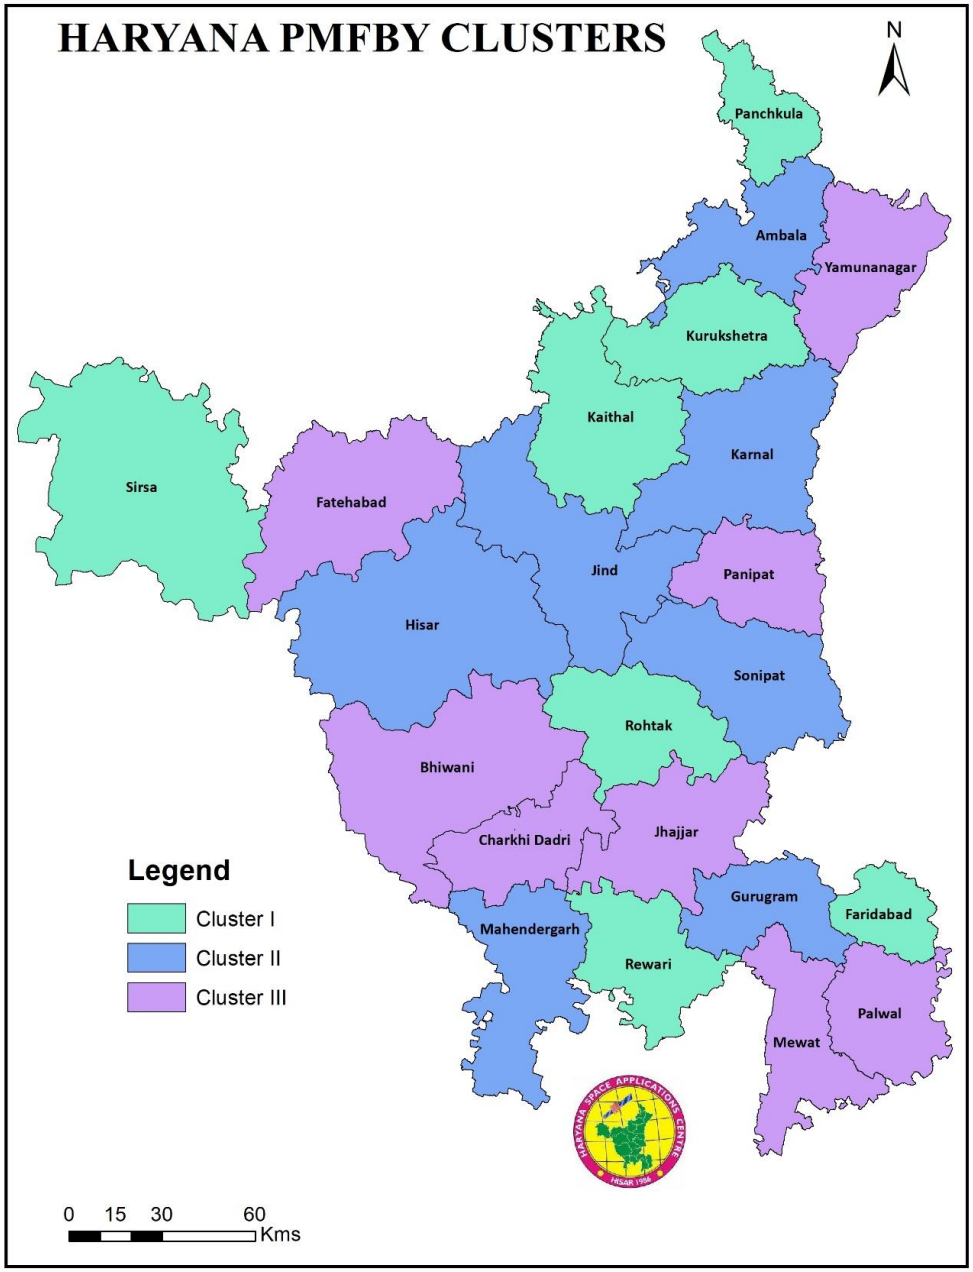

Figure 2: Cluster-wise representation of Districts, Haryana under YES-TECH, PMFBY

3. Data Used

3.1. Ground Data

In all 22 districts of Haryana, field staff were employed during the 2023-24 Rabi season to acquire crop-related field data. The staff acquired the ground truth data inventory of the Wheat Crop, the spatial distribution of which is shown in Figure 3 (a to c) respectively for cluster I, II, and III.

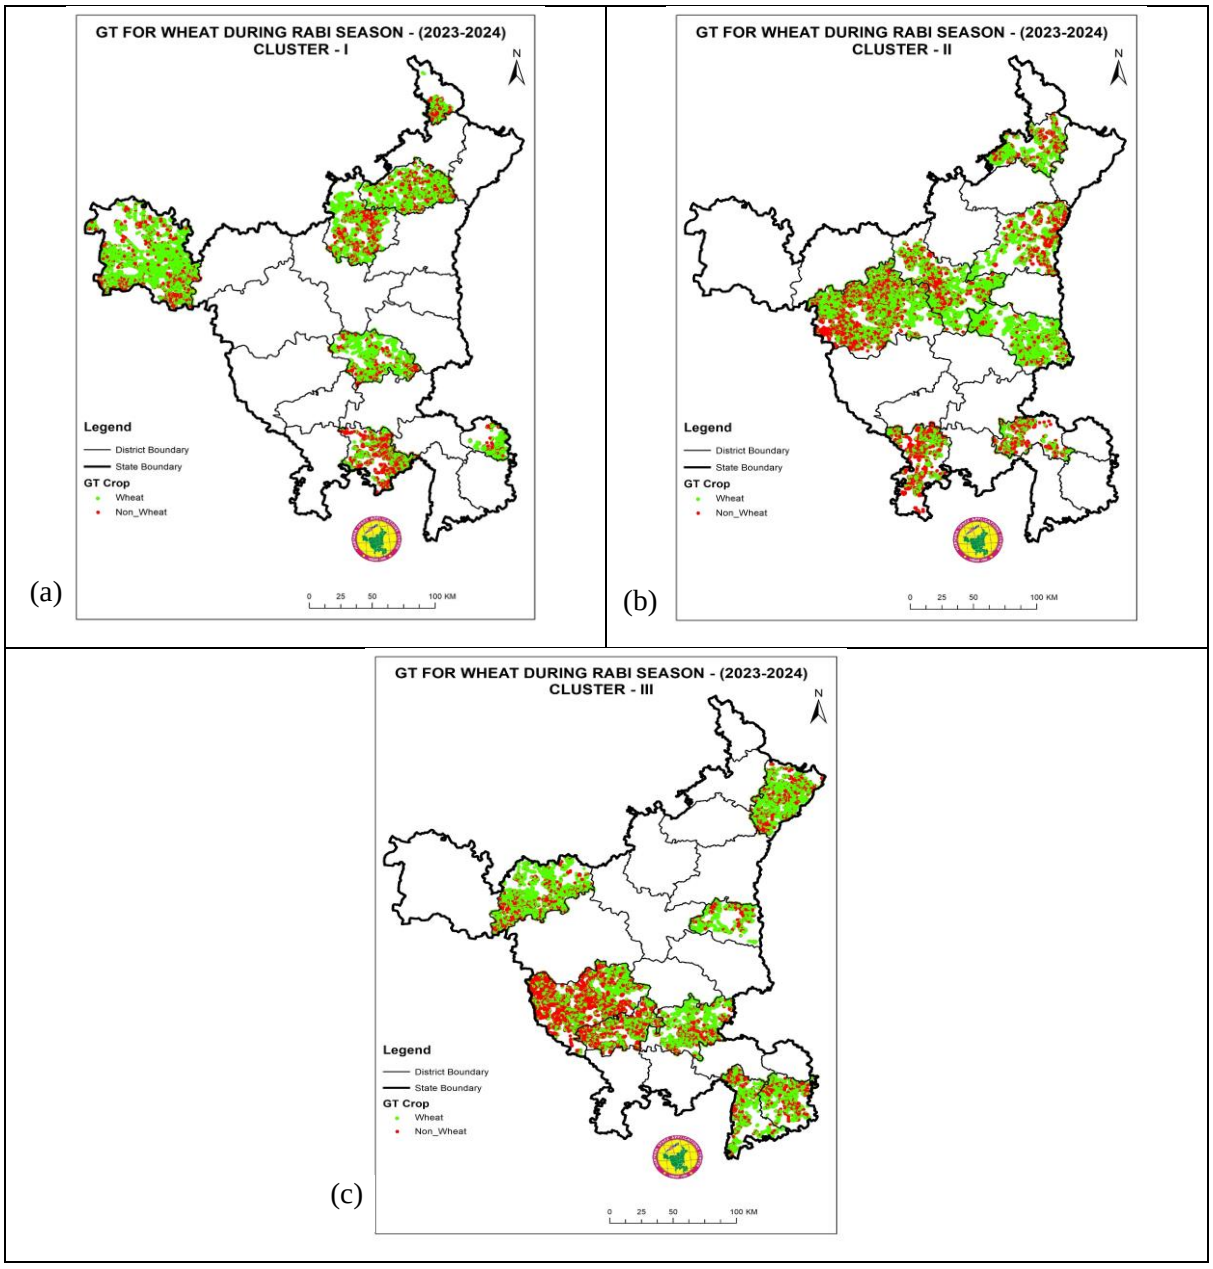

Figure 3. Spatial Distribution of Wheat Survey across Haryana in Rabi 2023-24.

3.2. Satellite Data

For the classification and crop mask generation, Sentinel-2 satellite data from both the A and B platforms, offering a 5-day revisit capacity, was obtained in the form of the Surface Reflectance product (S2MSI2A) from the European Space Agency's website (https://scihub.copernicus.eu/dhus/#/home). This product encompasses surface reflectance information, along with geometrically corrected and radiometrically enhanced data. Table 1 provides the district wise description with number of scenes and dates used.

Table 1: Description of Satellite Data with number of scenes and dates used for classification.

District_Name	**Selected Date for Classification_ (DD-MM-YYYY)**	Tile ID

A generic description of the datasets used by HARSAC for Yield estimation using Semi-Physical model is listed in Table 2.

Table 2: Datasets Used by HARSAC for Yield Estimation using Semi-Physical Model

Data/Product	**Satellite/Ground**	**Sensor**	**Resolution**	**Source**
Daily Integrated Insolation (PAR)	INSAT 3D	Imager	4 km (resampled at 10 m)	MOSDAC
8-days composite FAPAR	Terra Sentinel 3	MODIS OLCI	0.5 km 0.3 km	NASA-EARTHDATA ESA
8-days composite surface reflectance	Terra Sentinel 2	MODIS MSI	0.5 km 10-20 m	NASA-EARTHDATA
NDVI and LSWI	Sentinel 2	MSI	10-20 m	Developed by TIP
Crop-mask (5-30 m) resolutions	Sentinel 2	MSI	10 m	Developed by TIP
Crop sowing date	Terra	MODIS	500m	Developed by TIP
Harvest Index	Ground	CCE	IUs Level	CCEs conducted by State
Daily T_{min} and Tmax (for Temperature Scalar (Ts)	IMD	Interpolated temperature	5*5 Km grid	IMD/Space Applications Center (SAC), ISRO Ahmedabad
Light Use Efficiency (LUE)	From Literature, considering the agro climatology of the study area along with crop type			

4. Methodology

4.1. Field Data Collection

Methodology aready described in Mid-Season Report (MSR) and can be depicted in Figure 4 had been used to create a comprehensive database of ground surface features, including land cover information and crop inventory data, and satellite imagery.

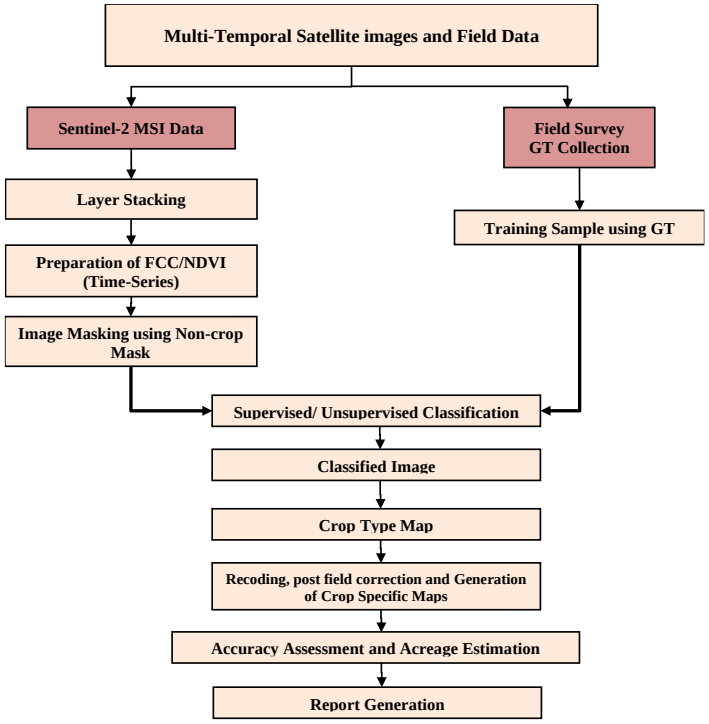

Figure 4: Flow-chart of methodology followed for pre-processing and classification of satellite data for extracting crop pattern map

4.3. Smart Sampling and CCE Data Collection

The location for performing the CCEs using smart sampling approach are generated collaboratively by MNCFC and HARSAC. These locations are then forwarded to the Department of Agriculture for a combined use in CCE data collection. Subsequently, the collected CCE data by HARSAC, was utilised for further analysis and validation of estimated yield. This integrated dataset plays a crucial role in both Yield modeling and validation processes. Since the agriculture department, compile CCEs data late, they may be used for the further analysis and validation of data obtained in the current exercise at later stage.

4.4. Yield Modelling

The project's primary aim is to develop a comprehensive yield modelling system for Wheat (Rabi season) in Haryana. The model framework (flowchart) furnished in Figure 5 represents the methodology for crop yield estimation using semi physical model. Details are described in MSR.

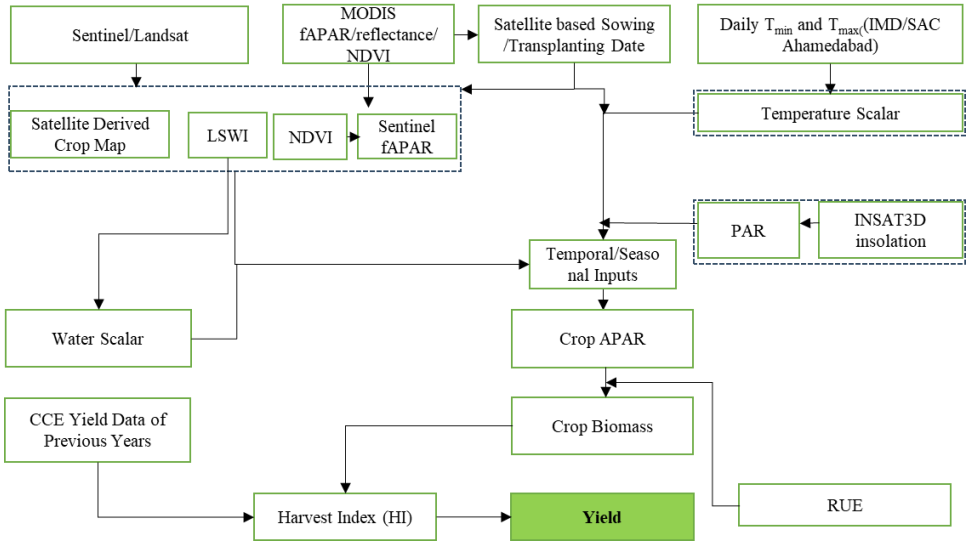

Figure 5: Methodology for Crop Yield Estimation using Semi physical approach.

4.5. Accuracy Evaluation

Accuracy Evaluation were performed through the Validation of Estimated Yield with reference to the Observed Yield (from CCEs). Various parameters like Root Mean Square Error (RMSE), Mean Absolute Percentage Error (MAPE), Normalised Root Mean Squre Error (NRMSE), Karl Pearson coefficient of correlation (r), Coefficent of Determination (R2), Index of Agreement, and t-Test. Details may be obtained in MSR.

5. Results and Discussion

5.1. Description of Field Data

Ground data were collected through geofenced mobile app. *G-fasal* for the classification and validation. A total of 385463 samples were collected in various districts. The district-wise sample distribution is provided in Table 3.

Table 3. District Wise Wheat Crop GT count for Rabi 2023-24.

22	Yamunanagar	16165
Total		**385463**

5.2. Crop Area Estimations

The total Wheat acreage in Haryana was estimated to be 1,417.20 thousand hectares. The district-wise acreage of the Wheat crop is detailed in Table 4. Clusters are delineated by colors and presented just below the table. The Wheat maps for Cluster-I districts, Cluster-II districts, and Cluster-III districts are depicted in Figure 6, Figure 7 and Figure 8 respectively. Map accuracies ranged from 0.74 to 0.97. The accuracy of Wheat crop mapping showed a variable range due to various reasons such as crop homogeneity, small farm size, high diversity of crops, mixing of spectraly similar crops, and coverage of the corp with respect to total geographical area of a region. The lower accuracy was obtained mainly for the southern districts exhibit all these characterist. Therefore, enlisting of associated crops, at district level have been provided at Table 5. The separability analysis (Jeffries–Matusita (JM) distance) showed results where the spectraly similar crops are having less separability i.e. less JF distances (*Table* 6). Tbale 6 dipicts average and minimum separability along with class pairs. There are five spectrall different crops and five spectrally similar crops have been taken for the spectral separability and presented in Table 6. The crops are numbers from 1 to 10. While doing spectral separability crop with number 1 were compared with other crops having number 2 to 10 and thus a total of 9 pairs were used for separaility analysis of crop 1 i.e. Gram1. The class pair 1:6 is Gram crop (i.e. Gram1, Gram2) hence have less JF distance i.e. 1411. Similarly, class pair 2:3 are Mustard1 and Mustard2 thus same crop (Mustard) and have less JF distance i.e. 1155. At the same time Class pair 3:4 represents separability between Mustard and Wheat (i.e. Mustard2 and Wheat1) having maximum JF distance i.e. 1414 which means Musterd and Wheat were spectrally separable in the satellite images. Other results can also be

interpretaed in the similar way. Cluster-wise and district-wise accuracies are outlined in Table 7, Table 8, and Table 9 respectively, for Cluster-I, Cluster-II, and Cluster-III.

Table 4. District Wise Area under Wheat Cultivation in Rabi 2023-24.

Districts	Tech. Area ('000 ha) 2023-24

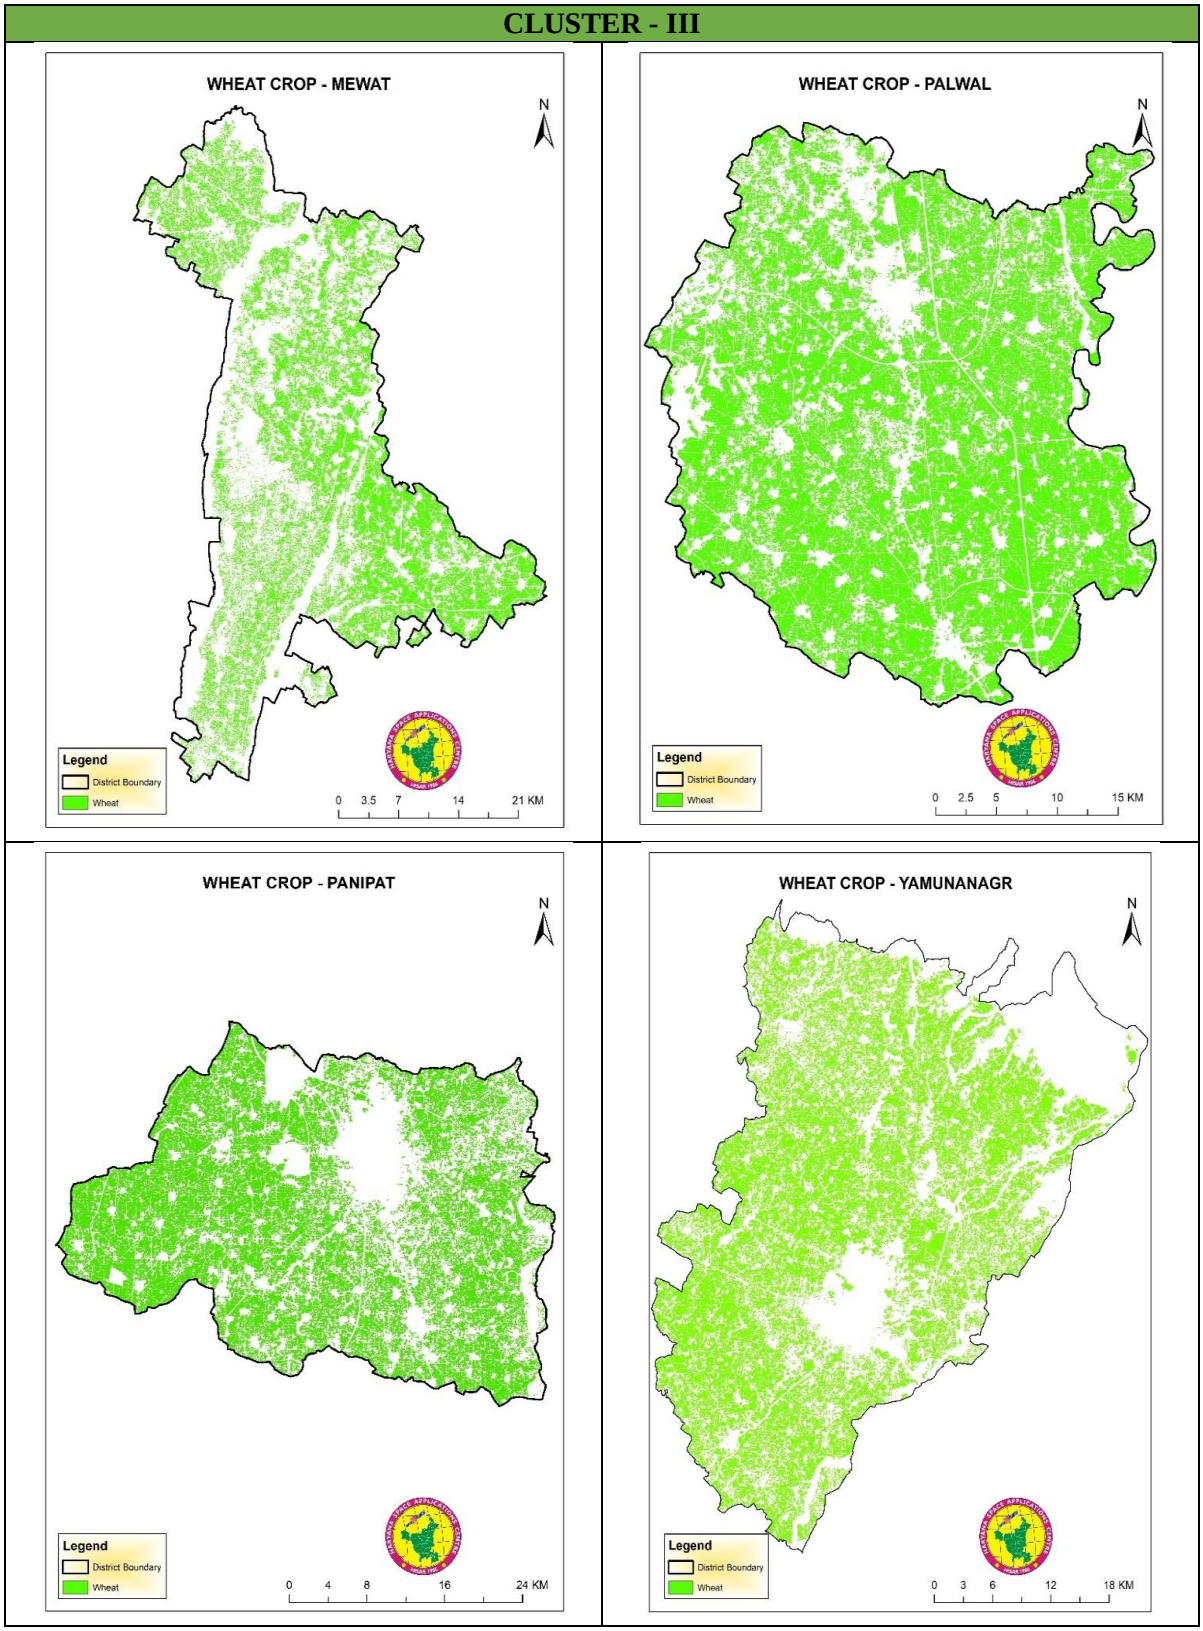

Figure 8: District Wise Crop Map of Wheat for Cluster III (Rabi 2023-24)

Table 7 depicts the confusion matrix for the districts falling in cluster-I. Five districts inclusing Kaithal, Kurukshetra, Panchkula, Sirsa, Rohtak exhibit overall accuracy < 90 % while two districts including Faridabad, Rewari exhibit over all accuracy of >90%. The highest accuracy of Wheat crop (93%) was achieved in Rewari district. Moreover, more than 80% accuracy for Wheat crop was also achieved in other districts.

5.3. Suitability of Smart Sampling (Stratification Efficiency)

The smart sampling procedure has been adopted for the collection of CCEs data. The sample locations were identified using crop health stratified data. It was observed that the Yield estimated had followed the crop health pattern (Figure 9) properly showing a good agreement and suitability of smart sampling in the YES-TECH estimates where the CCEs are decided based on crop health pattern. The pattern has been obtained as a summation of NDVI during current crop season.

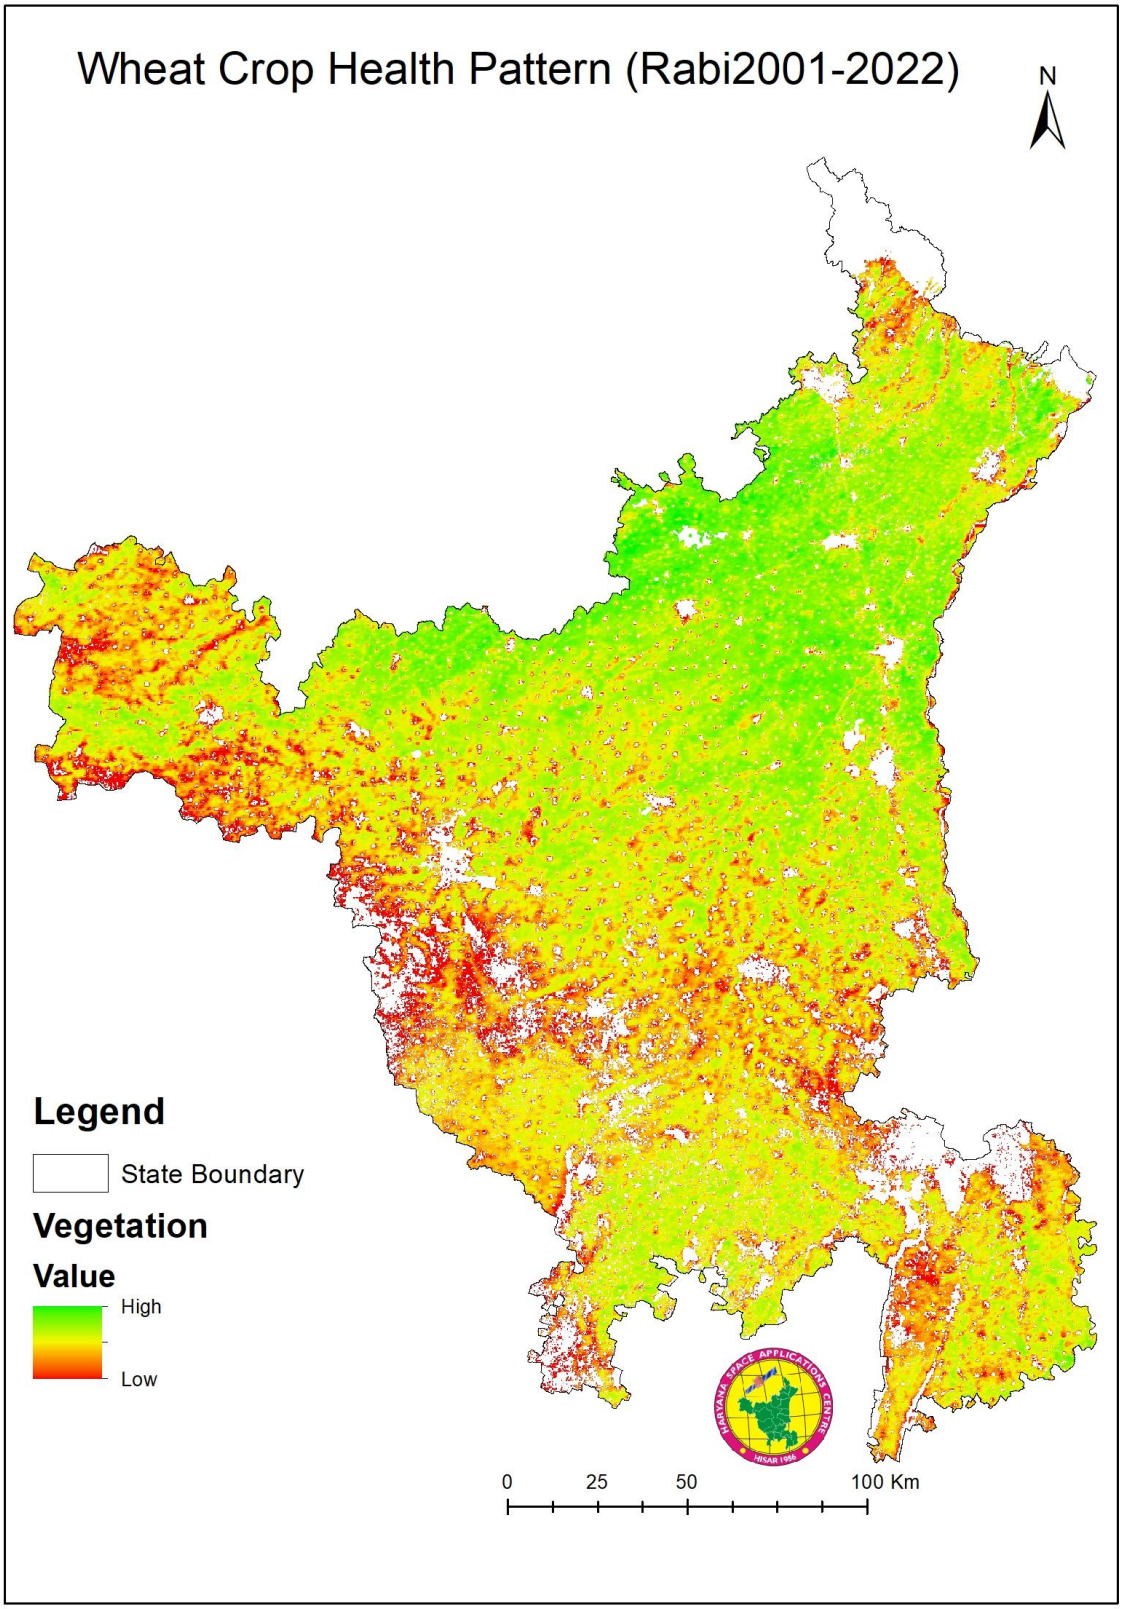

Figure 9. Vegetation Health Pattern Pattern for in Rabi 2023.

5.4. CCE data description

The standard procedure of CCEs have been followed to obtain ground data related to the Wheat yield. The HARSAC team visited along with the team of agriculture department Haryana and utilized G-fasal geofenced mobile app for the data collection. A total of 185 points distributed in various villages were selected for CCE, well distributed in various yield groups (Low, Medium, High) as per the suggested guidline of YES-TECH manual. Four locations at each village were selected for the experiment. The whole Wheat crop was harvested in a dimention of 5×5 meters plot and weighted using electronic weight. The minimum yield obtained was 2244 Kg/ha and maximum was 5959 Kg/ha from CCEs experiment on these sites.

5.5. Yield Estimation and its Evaluation

The yield was estimated using satellite-based data, including insolation, PAR, NDVI, LSWI, water scalar, and fAPAR following the methodology given in YES-TECH manual with technical guidance from SAC for input parameter generation including the transplanting date, which is an important parameter for aggregating the biomass for the whole rice season. The primary inputs were similar to the suggested parameters in the YES-TECH manual.

5.5.1 NDVI pattern

The NDVI for the Wheat crop ranged from ≃0.1 to ≃0.8. The district-level time-series NDVI pattern followed the crop growth pattern from transplanting date to harvesting date obtained in the current season. The distribution of NDVI in all 22 districts of Haryana is presented in Figure 10, Figure 11 and Figure 12 for the three clusters viz. cluster I, cluster II, and cluster III respectively.

The NDVI values were estimated for all the districts in Cluster-I and ploted againt the time. There were some missing values in the datasets due to cloud cover which were filled using average value of NDVI of previous and next dates. In all the districts of Cluster-I, NDVI plots (Annexure-1 and Annexure-2) indicates, the November-December as initial crop sowing dates (NDVI varies from 0.1 to 0.5 approx.) or spectral emergence, the January-February depict peak growth stages (NDVI varies from 0.5 to 0.8 approx.), and the March-April signify crop maturity/harvest stage (NDVI varies from 0.8 to 0.08 approx.). The temporal pattern of NDVI showed relatively low vegour but having minor differences as compared to the past years average in all the clusters (Annexure-2).

With the exception of January to March in the years 2021–2022, the NDVI plot for the Sirsa district shows normal curve for the sowing stage and maturity stage from 2019–2024. The consistent NDVI values observed during Jan-March, 2021–2022 could be the result of potential cloud factors. In the Faridabad district, there is a noticeable increase in NDVI from December 15 to February 15 in the 2019-

2020 period. However, after February 15, the NDVI trend shows a decreasing pattern which shows the crop maturity.

Despite consistent monthly trends for crop growing stage, harvest stage, and sowing stage in Kurukshetra district, farming practices cause annual variations in NDVI values. This discrepancy raises the possibility that vegetative health is sensitive to shifting environmental factors, which could affect NDVI values obtained from satellite data. In Panchkula, NDVI fluctuations could be influenced by cloud cover, particularly during the sowing phases, similarly due to the cloud possibilities in the target area, NDVI trends in the Rewari district are inconsistent. The NDVI trends in Kaithal district show variations in wheat growth stage, particularly noticeable when comparing different years.

The NDVI pattern for the Rohtak district from 2019–2024 shows an increasing tendency from November to January. But because of the crop maturation stage, there is a declining trend in the NDVI from February to March after January.

The provided plots (Annexure-2) illustrate the NDVI profile comparison for the Rabi season in the districts of Cluster-I, comparing the current season (2023-2024) with the average NDVI from the past four years (2019-2022). The NDVI profile for the current Rabi season shows both similarities and deviations when compared to the average NDVI profile of the past four years across various districts. For most districts, the current season NDVI follows the historical trend, indicating stable vegetation health. However, notable deviations can be observed in districts such as Faridabad and Rewari, where the current season NDVI is significantly lower than the average. This could be might be indicative of potential stress factors affecting the crops in these regions, such as adverse weather conditions.

The NDVI values were estimated for all the districts in Cluster-II and ploted againt the time as presented in Annexure-1. Some missing values in the datasets due to cloud cover were filled using the average NDVI value of the previous and next dates. In all the districts of Cluster-II, NDVI plots **(**Annexure-1**)** indicate the following stages:

- November-December: Initial crop sowing dates or spectral emergence, with NDVI values ranging from approximately 0.1 to 0.5.
- January-February: Peak growth stages, with NDVI values ranging from approximately 0.5 to 0.8.
- March-April: Crop maturity/harvest stage, with NDVI values declining approximately 0.8 to 0.08.

All districts of Cluster-II exhibit a normal NDVI curve consistent with typical crop growth stages. During the sowing stage, NDVI values are relatively low. These values begin to rise at the end of December and peak between January and February, aligning with the crop growth stage. From late February or early March, NDVI values decline, reflecting the crop maturity

stage. Variations in NDVI values across different years can be attributed to several factors, including cloud cover affecting the satellite imagery. Overall, the NDVI trends in these districts are consistent with the expected patterns of crop development, highlighting the influence of seasonal changes and external factors on vegetation health.

The provided plots (Annexure-2) illustrate the NDVI profile comparison for the Rabi season in the districts of Cluster-II, comparing the current season (2023-2024) with the average NDVI from the past four years (2019-2022). The NDVI profile for the current Rabi season shows both similarities and deviations when compared to the average NDVI profile of the past four years across various districts. For most districts, the current season NDVI follows the historical trend, indicating stable vegetation health. However, notable deviations can be observed in Mahendragarh district, where the current season NDVI is significantly lower than the average during the peak growing stage of the crop. This could be because of cloud cover.

The NDVI values were estimated using Sentinel-2 data for all the districts in Cluster-III. There were some missing values in the datasets due to cloud cover, which were filled using the average value of the NDVI for the previous and next dates. In all the districts of Cluster-III, NDVI plots (Annexure-1) indicate the November-December as initial crop sowing dates (NDVI varies from 0.1 to 0.5 approx.) or spectral emergence, the January-February depict peak growth stages (NDVI varies from 0.5 to 0.8 approx.), and the March-April signify crop maturity/harvest stage (NDVI varies from 0.8 to 0.08 approx.).

All districts of Cluster-III (Annexure-1) exhibit a normal NDVI curve, consistent with typical crop growth stages. During the sowing stage, NDVI values are relatively low. These values begin to rise at the end of December and peak between January and February, aligning with the crop growth stage. From late February or early March, NDVI values decline, reflecting the crop maturity stage. Variations in NDVI values across different years can be attributed to several factors. Constant and fluctuating NDVI trends were also observed in certain periods, which might be due to cloud cover affecting the satellite imagery or differences in farming practices. Additionally, environmental factors such as weather disturbances and pre-monsoon conditions can influence NDVI trends of crop maturity. Overall, the NDVI trends in these districts are consistent with the expected patterns of crop development, highlighting the influence of seasonal changes and external factors on vegetation health. The provided plots (Annexure-2) illustrate the NDVI profile comparison for the Rabi season in the districts of Cluster-III, comparing the current season (2023-2024) with the average NDVI from the past four years (2019-2022). The NDVI profile for the current Rabi season shows both similarities and deviations when compared to the average NDVI profile of the past four years across various districts. For most districts, the current season NDVI is not following the historical trend, indicating an unstable NDVI curve. This could be indicative of potential cloud cover and stress factors affecting the crops in these regions, such as adverse weather conditions.

5.5.2 Sowing date

The spatial pattern and distribution of sowing dates were estimated for all 22 districts and are presented in Figure 13, Figure 14 and Figure 15 across the three clusters. Sowing dates varied from 305 Julian days to 353 Julian days. Julian day 305 depicts 1 November, Julian day 321 depicts 10/15 November, Julian day 337 depicts 25/28 November and 353 Julian day depicts 10 December. Early sowing dates were observed in Southern districts, while late sowing dates were noted in Northern districts. The cluster-wise and district-wise calender dates/date ranges obtained as sowing dates for the further calculation are presented in Table 10. These dates/date ranges can be well correlated with the maps presented in Figure 13, Figure 14 and Figure 15 for cluster-I, Cluster-II, and Cluster-III respectively.

Table 10:District-wise Sowing dates.

Sr. No	Districts Name	Sowing Date (2023-24)	Cluster

5.5.3 Inputs for the semi-phisical model

The inputes for semi-physical model are described in forthcoming sections. These inputes are PAR, Water Scaler, Temperature Scalar, and fAPAR. These inputes provide the APAR after inputing them in semi-physical model as described in section 4.4. PAR is utilized as sum for a defined date range while the temperature scalar is used as average for that date range. The water scalar, and fAPAR are used as such after deriving it using formula provided in section 4.

5.5.3.1 Photosynthetically Active Radiation (PAR)

PAR data was derived from INSAT insolation on daily basis. This data was further summed up for specific date range (as per the availability of other inputes like TS, WS, fAPAR) to be used to estimate Absorbed Photosythetic Activ Radiation (APAR). Sum of PAR for whole season at district level for all the three clusters is presented in Annexure-5. The sum-PAR values range between 700 to 900 MJ for all the districts in Haryana during rabi season. The PAR-sum for Faridabad (Cluster-I) maily falls between 750 MJ to 850 MJ with the dominance of 750-800 MJ category. The Karnal and Kurukshetra districts of cluster-I showed dominant PAR-sum value between 750-800 MJ. Mahendragarh district of cluster-I showed PAR-sum values between 750 to 850 MJ with higher values ranges in southern part and lower range in the northern part of the district. Similar range of PAR-sum was found to be for Panchkula. The Rewari district of cluster-I showed dominant range of PAR-sum between 800-850 MJ. Both the Rohtak and Sirsa (cluster-I) showed PAR-sum between 700-800 MJ.

PAR-sum for cluster-II districts also showed similar ranges. Ambala district showed dominance PAR-sum value of 800-850 MJ While Gurugram showed domanace of 750-800 MJ. Similarly, Hisar showed dominance of 750-800 MJ while Jind showed dominance of 700-800 MJ. Sonipat exhibit PAR-sum in the range of 750 MJ to 800 MJ as dominant category while Sonipat district exhibit PAR-sum in the range of <750 MJ as dominant category.

The PAR-sum ranges for cluster-III districts falls between 700-900 MJ. Bhiwani district which falls in cluster-II showed PAR-sum values between 800-900 MJ while Charkhi dadri (cluset-II districts) showed PAR-sum in the range of 750-800 MJ. Fatehabad district have displayed PAR-sum of 750-800 MJ is major parts while Jhajjar showed PAR-sum of 700-750 MJ is major parts. However, the southern part of both these districts showed relatively higher PAR-sum values in the range of 800-900 MJ. Mewat showed relatively low dominant range of PAR-sum i.e. <750 MJ. Palwal district showed mixed dominance of 750-800 MJ range and 800-850 Mj range. Unifarm PAR-sum was observed in Panipat district in the range of 750-800 MJ while Yamunanagar exhibit 750-800 range in its southern part and 800-850 MJ in the northern part of it.

5.5.3.2 Water Scalar

Water scalar has been estimated using Sentinel-2 data. District-wise water-scalar maps in each cluster i.e. cluster-I, cluster-II, and cluster-III is presented in Figure 16, Figure 17, and Figure 18 respectively. The values of water scalar were ranging from 0.3 to 1 for the Wheat crop. Most of the values were skewed towards higher ranges in all the districts which showed relatively low water stress in Haryana region. Higher values of water scalar during January, February, and March showed very less stress. The time-series values of water-scalar follow the pattern of plant growth where the higher values were obtained during January to March (peak growth season), while lower values of water scalar were found during November-December (crop planting season), and April (Ripening season).

5.5.3.3 Temperature Scalar Variations

Temperature scalar (Ts) is the important parameter in semi-physical model while using for Wheat crop. Most of the districts in Haryana showed range og Ts between 0.4 to 1. The district-wise spatial distribution of Ts is presented at Figure 19, Figure 20, and Figure 21 for cluster-I, cluster-II, and cluster-III respectively.

The Ts values in Faridabad (which a cluster-I district) are variyng in the range of 0.4 to 1 with high values during November, March and April and relatively low values during winter months i.e. December and January. The Ts values in Kaithal, Kurukshetra, Panchkula, Rewari, Rohtak, and Sirsa districts (which are also falling in cluster-I) are following the similar pattern (Figure 19).

The districts fall in cluster-II are Ambala, Gurugram, Hisar, Jind, Karnal, Mahendragarh, and Sonipat. The Ts mainly ranges between 0.5 to 1 for all the districts of cluster-II. Relatively

higher values of Ls were obtained during November, March and April while lower values were seen during December, January and February (Figure 20).

The districts fall in cluster-III are Bhiwani, Charkhi Dadri, Fatehabad, Jhajjar, Mewat, Palwal, Panipat, and Yamunanagar. The Ts ranges mainly between 0.4 to 1 for all the districts of Cluster-III (Figure 21). Relatively lower values of Ts were obtained during November, February, March, and April while higher values of Ts were seen during December, Jauary and February.

5.5.3.4 FAPAR Estimation

FAPAR was estimated for each district falling in cluster I, II, and III. The FAPAR values were ranging from 0.01 to 1. The NDVI obtained from sentinel-2 data was converted to the FAPAR using a linear model obtained from a relationship between MODIS-based FAPAR and Sentinel NDVI. Cluster-wise and district-wise, linear model, and coefficient of determination (R^2) is presented in Table 11.

Table 11: Cluster-wise, district-wise linear models used for FAPAR estimation.

Cluster-I

Districts	Model	R2
Panchkula	**y = 0.9386x + 0.0393**	**R^2 = 0.9150**
Kurukshetra	**y = 0.9534x + 0.0502**	**R^2 = 0.8511**
Faridabad	**y = 0.89x + 0.0716**	**R^2 = 0.9157**
Kaithal	**y = 0.9857x + 0.0312**	**R^2 = 0.8798**
Sirsa	**y = 0.8342x + 0.0931**	**R^2 = 0.9600**
Rohtak	**y = 1.0562x + 0.0233**	**R^2 = 0.8188**
Rewari	**y = 0.986x + 0.0313**	**R^2 = 0.8701**

Cluster-II

Districts	Model	R2
Ambala	**y = 0.9616x + 0.0404**	**R^2 = 0.9558**
Karnal	**y = 0.9601x + 0.0443**	**R^2 = 0.8730**
Sonipat	**y = 0.9909x + 0.0222**	**R^2 = 0.8311**
Hisar	**y = 0.9706x + 0.0359**	**R^2 = 0.9730**
Jind	**y = 0.9891x + 0.0573**	**R^2 = 0.8111**
Gurugram	**y = 0.993x + 0.0064**	**R^2 = 0.9726**
Mahendragarh	**y = 1.0377x + 0.0009**	**R^2 = 0.9361**

Cluster-III

Districts	Model	R2
Yamunanagar	**y = 0.9174x + 0.0615**	**R^2 = 0.9050**
Panipat	**y = 0.9886x + 0.0223**	**R^2 = 0.9351**
Palwal	**y = 0.9881x + 0.0314**	**R^2 = 0.8951**
Bhiwani	**y = 0.9328x + 0.0508**	**R^2 = 0.9620**
Fatehabad	**y = 1.0225x - 0.0045**	**R^2 = 0.9815**
Jhajjar	**y = 0.9823x + 0.0098**	**R^2 = 0.9563**
Mewat	**y = 0.9492x + 0.0301**	**R^2 = 0.9655**
Charkhi Dadri	**y = 1.0319x + 0.0018**	**R^2 = 0.9456**

The spatial distribution of district-wise FAPAR for the cluster-I, cluster-II, and cluster-III is presented at Figure 22, Figure 23, and Figure 24, respectively. The FAPAR values ranges from 0 to 1.

5.5.4 Biomass

Biomass estimates were derived utilizing district-level layers following the guidelines outlined in the YES-TECH manual. The biomass ranged from 2200 Kg/ha to 15000 Kg/ha. The majority of biomass fell within the range of 7500 Kg/ha to 10000 Kg/ha at IUs level. The central and southern region of the state exhibited higher biomass values, whereas the southern parts demonstrated lower biomass. Some abrupt values were observed, attributed to scale variations in the input datasets. These values were excluded in the final yield assessment. Figure 25, Figure 26 and Figure 27 illustrates the district-wise distribution of biomass in each cluster. The biomass pattern was similar to the NDVI pattern.

5.5.5 Yield Estimation and Validation at Insurance Units level

The model estimated yield at village level varied between 2183 Kg/ha to 5511 Kg/ha, with the central and northern part of the state displaying relatively higher yield values. Detailed village-level yield information is provided in Annexure-3. Number of villages in various yield categories including <3000 kg/ha, 3000-4000 kg/ha, 4000-5000 kg/ha, and >5000 kg/ha are provided in Annexure-4. The model slightly underestimated the yield as compared to reported yield of past year, but the deviation in 99% of villages are within 30%.

The yield map of the state, at pixel level, is illustrated in Figure 28. The yield data demonstrated strong agreement with ground data when compared to the previous year's information where most of the deviation (in ≃6000 villages) falls within 15%. The spatial distribution of biomass HI, and yield in Haryana is also depicted in Figure 28. Validation of predicted Yield showed a very good correlation of 0.83 with root mean square error (RMSE) of 558 Kg/ha. All other statistical parameters are presented in Table 12. Figure 29 is showing the validation plot for predicted and observed yield of Wheat in Haryana during Rabi 2023-24. Village-level yield map for each district falling in cluster-I, cluster-II, and cluster-III is presented in Figure 30, Figure 31 and Figure 32.

6	t-Test	Significant (Cal-value=13.17)
7	Index of Agreement	0.84
8	No. of Sample's	185

6. Summary and Conclusions

- Satellite-based measurements have been found suitable for the Wheat crop mapping at a spatial resolution of 10 meters. The mapping accuracy of Wheat varies from 81% to 95 %. Fortunatly, the cloud free images were available for the current season which supported the preparation of model inputes and running the model for yield estimation.
- NDVI pattern analysis showed progression of Crops in Sown area. The NDVI ranges between 0.1 to 0.8 during the crop growing period. The values were less during curret season as compared to the previous year average in most of the Wheat regions.
- There are six dates observed as sowing dates including 01 November, 05 November, 15 November, 25 Novemeber, 01 December, 10 December. In most of the districts the dominant sowing dates were falling within the range of 15 November to 01 December.
- The FAPAR and NDVI showed high coefficient of determination (R^2) ranging between 0.81 to 0.98. FAPAR values were found to be in the range of 0.01 to 1.
- During different crop growth period water scalar values were ranging from 0.3 to 1 in the region. Most of the scalar values were found to be higher side showed relatively low water stress in the region.
- Temperature scalar values range 0.4 to 1. Values for temperature scalar were found to be higher during Novemebr, February, March and April, While less during December, and January.
- Biomass ranges between ≃2200 Kg/ha to ≃15000 Kg/ha in the Wheat regions of Haryana. The majority (80%) of biomass range was found within the range of 7500 Kg/ha to 10000 Kg/ha.
- Modelled yield of insurance units (IUs) for the current year at village level showing the range between ≃2100 Kg/ha to ≃5500 Kg/ha (**Anneure-3**). Comparison between estimated and observed yield (data from CCEs) for the current year at village level showed incouraging results with the correlation coefficient (r) of 0.83 and RMSE of 558 Kg/ha.

- The Yield data at IUs level is provided at Annexure-3 in a standard manner, ready to use for the crop gain/loss assessment. Most the IUs (99%) falls within the deviation range of ≤30%.
- The Semi-physical model is found to be one of the suitable tools for the yield assessment which can further be extended for other crops as well in future. Field level Yield assessment may also be executed on the requirement.
- Currently the Technology-based yield is having 30% blending rate which may be increased up to 50 percent in near future gradually.

7. Comments and Recommendations of MITR, State and ICs

Comments from MITR	Action taken
Overall comments: As the yield estimation involve many steps, which are linked, hence TIP should verify the intermittent result at each step. After final calculation, it is difficult to incorporate the suggestions for initial steps. For example, when we found some mistakes in planting date or FAPAR calculation then all calculations for yield will have to be repeated for correctness of the method. Kindly note that.	Thank you for the comments. Consultation was made with MITR through online discussion for major steps like planting date and Temperature stress. Next season onward care will be taken to make consultation with MITR at each step of input generation for improving the accuracy.
Total page-626 including annexures- Try to keep the page limit at 100 or at max 150	No of pages were reduced to 388 in the revised report.
Control Sheet for YES-TECH implementation (MSR) **1.** Please replace the MSR with ESR in column no 4, 5, 6 and 7-Report / Document Type, Document Control Number, Title YES-TECH implementation document MSR in Haryana state **2.** Check the page number and no. of tables and figures and rectify in the sheet **3.** TIP is originating unit and affiliation centre, hence change accordingly	Corrections incorporated Corrections incorporated Corrections incorporated
Abstract **1.** Replace the description about the model i.e ''This innovative model, which integrates both physical and statistical components, builds upon the Radiation Use Efficiency (RUE) framework proposed by Monteith in 1977. The model leverages a comprehensive understanding of the biochemical processes underlying plant-light absorption for photosynthesis, radiation use efficiency, stress factors (Water stress, Temperature stress), accumulated biomass, and grain yield. The strength of the Semi-Physical Model lies in its adoption of a process-based framework with limited parameterization, making it a recognized and superior alternative to simple empirical modelling methods'' with the following paragraph. This model is developed by SAC (Tripathy et. al., 2014) which is based on the monteith's efficiency model (Monteith, 1977) with	Corrections incorporated

the inputs form satellite remote sensing and was implemented under YESTECH after being selected by the YESTECH committee based on the results from pilot studies. The model inputs are PAR, FAPAR, environment scalars (water and temperature), crop specific RUEmax and cultivar specific harvest index. **2.** The statement like high accuracy should be corroborated by providing the range of accuracy % in bracket. **3.** Only mention the yield range across IUs. No validation statement required to be given in the final report. **4.** Include satellite remote sensing among keywords	Corrections incorporated Corrections incorporated Corrections incorporated
Executive Summary **1.** SST part is not required in the final report. **2.** Paragraph 3- instead of simply semi-physical model remote sensing-based SPM may be used. **3.** Paragraph 4- Few lines from the experience of implementation of yestech for rice yield may be cited as background to take this model for wheat as well. **4.** Paragraph 5- Include one statement regarding the major takeaway from this report that is the model estimated yield at IU level for claim settlement. **5.** Also, provide your view on increasing the percent of modelled yield beyond 30% based on your confidence gained from this year's implementation. Precision farming term should be omitted.	Corrections incorporated. Only essential part is conserved. Corrections incorporated Corrections incorporated Corrections incorporated Corrections incorporated
Introduction 1. One line on the rice season for YESTECH may also be added as background work. **2.** Under the publication from HARSAC, few recent publications may be added if any.	Corrections incorporated Corrections incorporated
Study area **1.** Number of IUs under each cluster may be mentioned in addition to the number of districts.	Corrections incorporated
Satellite Data	

1. For classification, why in some districts only Feb March data was used, though data for Nov, Dec and Jan is available for all districts.	The selection of data for crop classification was mainly dependent on the crop discrimination potential of specific image on specific dates. Thus, selective images have been used. This is also to be mentioned that, the past experience also confirms the dates to be correct for the wheat mapping. One exercise will be carried out to check the accuracy in classification with the use of full dataset in the coming season
2. For yield estimation, keep only one table for data used (either 2 or 3) with all input data. Incorporate the suggestions given the pdf as comment	Corrections incorporated. Only Table 2 has been conserved.
Methodology:	
1. Give brief description about the GFASAL.	Corrections incorporated
2. For pre-processing of satellite-data, only mention the software and the steps in brief. Details are not required. You may consider this sentence- pre-processing of satellite data, input generation and computation of yield were carried out using the ERDAS Imagine/ArcPro software.	Correction incorporated.
3. Replace digitalization with classification or clustering under the section 4.2.2 (Preparation of Non-Crop Area/Mask).	Non-crop mask is made using visual interpretation and digitization.
4. Section 4.3. Smart Sampling and CCE Data Collection- Mention the purpose of collecting the CCE-For verifying the estimated yield and building up of confidence, CCE was planned in 185 sites based on the SST approach....	Correction incorporated
5. Section 4.4. Yield Modelling-	--
6. Flow chart (fig 5) - delete resourcesat and add MODIS in the reflectance box	Correction incorporated
7. Delete transplanting date; keep MODIS NDVI in the first step, then planting date in the second step.	Correction incorporated
8. Add TS in the flow chart and link to APAR.	Correction incorporated
9. One transplanting date box needs to be removed	Correction incorporated
10. Seasonal APAR will be converted to biomass when RUEmax will be multiplied, so keep a biomass box after APAR. Then in the next step biomass will be converted to yield using HI. Rectify accordingly	Correction incorporated

11. Under raw data too delete resourcesat, add MODIS. remove LANDSAT also if not used.	Correction incorporated
12. Under derivative section, sequence of input should be properly placed- crop mask, planting date, PAR, FAPAR, WS and TS.	Correction incorporated
13. Under detail methodology for yield estimation, keep only five steps-	Corrections incorporated.
14. Crop mask generation, which already have mentioned in detail, 2. Planting date generation, 3. Model input generation-with the sub-steps for PAR, FAPAR, WS, TS and HI, 4. Biomass and Yield, 5. Validation with CCE. Briefly describe the methodology for each step	Correction incorporated.
15. For planting date, replace transplanting date with sowing date. such detail description is not required. Only the following sentence is enough - Sowing date is derived using time series NDVI from--- to -- period with ISODATA classification and higher order polynomial fit method.	Correction incorporated
16. For CCE, kindly note that, this year CCE data should not be used for computing HI. This year CCE should be only for verifying our result for confidence building. Accordingly change the statements in the CCE section.	This has been followed properly and CCE data for current year was used for validation only not for HI development.
17. Accuracy assessment	Accuracy is assessed as suggested/discussed.
18. The description of the statistical indicators for yield validation is not required. Only give methodology for accuracy assessment of crop mapping (Confusion matrix)	Corrections incorporated. Confusion matrix is also provided.
Results:	
1. Crop Area Estimations	Done as per the suggestions.
2. District-wise acreage is not required to be reported. Only give the crop maps and confusion matrix of each district.	Department of Agriculture (DoA) data has been scraped from the table. Only satellite derived acreage is presented as per the requirement of the department.
3. Table 5 is not required	Correction Incorporated.

4. For table 7 (Spectral Separability Analysis) - only give the graph with large legends and analysis result may be described in text	Corrections incorporated.
5. Describe District-wise Classification accuracy in text for each cluster. Mention the overall accuracy range in each cluster with group of villages with >80%, 80-90% and >90% accuracy range	Corrections incorporated.
6. Smart sampling description is not required	This is required as per the YES-TECH Guidline, hense not removed.
7. In the Vegetation Health Pattern map, correct the year in the chart title and legend too (2023-24) and overlay the CCE points over this.	The vegetation health pattern is actually developed using NDVI data of last 22 years i.e. year 2001 to 2022. We have conducted CCEs at village level hense points can not be overlayed rather village centroid may be added which again will not provide any new insight, hense it is not changed.
8. Under CCE data description, you have mentioned that a total of 185 points distributed in various villages were selected for CCE, well distributed in various yield groups (Low, Medium, High) as per the suggested guideline of YES-TECH manual-- do YESTECH manual include CCE stratification? if so, mention the chapter and page no for reference.	This is mentioned in Annexure-VIII of YES-TECH manual at page number 47, section-1.
9. Section 5.5.2- please replace transplanting date with planting or sowing date. In MSR also so many time it has been suggested to use sowing date not transplanting date, same mistake is seen here repeatedly. Please take care to incorporate such changes once suggested by us.	Now the Corrections are incorporated as per the suggestions.
10. Check table 11. if one sowing date in 1 Nov next would be at least 16 days after that, if 16-day NDVI is used. Please explain. Legends in the Sowing date maps are showing 4 different dates of sowing which seems to be correct. please check and change the table as per the	The sowing dates were calculated as per the method explained earlier and actual showing dates are mentioned in table 11. The Maps are showing distribution of these dates; Required changes has been done.

dates in map.	
11. In the text mention the calendar dates of sowing not the range.	Correction incorporated with best feasibility.
12. After planting date paragraph, make one title-input for the semi-physical model with five subtitle- PAR sum, FAPAR, WS, TS and HI in sequence of importance.	Correction incorporated
13. Reduce the size of the temporal maps to accommodate all maps of one input for one district in one page.	Corrections incorporated; however, it is not possible to add all the maps in one page.
14. For water stress and TS, mention the districts with more stress and those with no stress.	Corrections are done as per the requirement. It can be understood from map as well.
15. For FAPAR, check the regression line for Kaithal, Rohtak, Bhiwani, Ambala and Soneopat. Take points from different region of each class, Seems points have been selected within one large pixel of MODS FAPAR so for same FAPAR many NDVI values are there. Also check the equation for Jind where points in the range of 0.4-0.5 are very few.	Though less number of points has been taken under certain rangein the mentioned districts, but the line covers all ranges. Next year onward the number of polygons under each value range will be kept more or less same. Prior to finalization of the equation, consultation will be made with the MITR.
16. These graphs may be omitted in the final report.	Corrections incorporated.
17. What is there in page 311- maps shows FAPAR again, legend shows APAR. If APAR, delete, not required.	Apologies for typological error. This is FAPAR and correction incorporated.
18. What about PARsum maps, Include these. Mention the range for 8-day sum.	Correction incorporated. Seasonal PAR-SUM maps and description is added. 8-days PAR maps have not been generated while processing and hense could not be added in the report.
19. Maintain the sequence as suggested.	We have tried best to maintain sequence in whole report. The cluster-wise districts are arranged in alphabetic manner in whole report.
20. After input the next section should be biomass and yield at IU level.	Correction incorporated
21. For biomass and yield, please see the	All the required corrections are incorporated.

suggestions and answer the queries in the pdf.	
22. Biomass and yield should be averaged over IU not district. Text should describe the biomass and yield at IU level under each cluster. Mention the range of biomass and yield in each cluster for IU level. You may divide the range into four classes and accordingly mention the IUs. Keep the title for yield estimation as IU level yield estimation. Validation is for our own confidence not to be reported.	Corrections incorporated. A separate table has been added in the report as "Cluster-wise village Yield statistics in various Yield categories" which difines number of villages in each district in various yield categories. The validation results can not be removed as it is mandatory to be added.
23. In the figures, give IU wise biomass and yield with the IU boundary overlaid in the maps.	The IUs boundaries are not added due to security and future disputes.
24. Why annexure 1 with NDVI curves appears suddenly in line with yield results? check and correct.	Corrections incorporated
25. Comparison with past year yield is for our reference and confidence. Don't report.	Reporting the reference data and its comparison has been done in Paddy season as well hence no change has been made. If still required in may be removed.
26. Send the current year CCEs (185) along with the comparison scatter plot and table 13 in excel also the CCE shape file and the crop health map raster.	Correction incorporated and data was shared.
Summary:	
1. Include description about PAR.	Correction incorporated. The seasonal PAR-sum maps are added as annexure-5 in the report to maintain the current arrangement of the report.
2. Delete first paragraph.	Correction incorporated
3. In the second para, mention the accuracy range obtained for classification of wheat using the satellite data.	Corrections incorporated
4. In the third para, only describe the current	

season pattern compared to the previous normal year pattern. Other descriptions are not required.	Corrections incorporated
5. Para 4, Replace TP date with sowing date. Give number of dates observed in calendar day with in bracket, the most frequent ones in all districts along with the % of districts showing such major dates.	Corrections incorporated. Marking percentage area under various sowing date categories is difficult at this stage hence not added. This will be practiced in next season.
6. Description sequence should be PAR, FAPAR, WS and TS.	Corrections incorporated.
7. For biomass range, this value is different from the value mentioned in the biomass section. Give the details of the administrative level or pixel resolution.	Corrections incorporated.
8. Quantify your statement majority of' biomass range' in terms of percent.	Corrections incorporated.
9. In para 9 (yield) omit the calculated using semi-physical model. Kindly check the lower range, the lower range of yield should be less than that of biomass. Correct the annexure no. Delete para 10, 11 and 12.	Corrections incorporated.
10. Para 13 or last one may be discussed in meeting not through report.	Corrections incorporated.
11. Add one sentence suggesting future application of semi-physical model for IU level yield estimation of wheat under YESTECH based on your experience; And one sentence whether you suggest the percent of modelled yield to be increased beyond 30% under YESTECH.	Corrections incorporated.
Annexures:	
1. Delete Annexure1.	As per the observation and last year experience the stack holders ask for maintain year-wise growth curves, hence may be conserved.

2. Only give Annexure 2 (the average temporal curve for past year vs. current year NDVI). 3. Send excel sheet of annexure 3	Annexure-2 is maintained. Already communicated though mail dated 15 July 2024.
Second Correction	
Abstract: The paragraph containing the text ' This model is developed by SAC (Tripathy et. al., 2014) which is based on the monteith's efficiency model (Monteith, 1977) with the inputs form satellite remote sensing and was implemented under YESTECH after being selected by the YESTECH committee based on the results from pilot studies.' **may be replaced with the following paragraph** This model is developed by SAC for large area yield estimation with the inputs form satellite remote sensing (Tripathy et. al., 2014), which is based on the principles of monteith's efficiency model (Monteith, 1977). This model was modified for GP level yield estimation (Tripathy et al., 2022) and was implemented under YESTECH after being selected by the YESTECH committee based on the results from pilot studies. The model inputs are PAR, FAPAR, environment scalars (water and temperature), crop specific RUEmax and cultivar specific harvest index.	Correction Incorporated
Section: 5.5.3 page 67- correct spellings in the title	Correction Incorporated
Section 5.5.3.4 may be placed as first input (section 5.5.3.1)	Thank you for the valuable comment. However, we feel that the current arrangement is as per the model inputes. It will also not do any technical modification in the report rather increase the efforts and lot of additional changes. Hence it is not done.
Section 5.5.5 (page 128)- 1. The sentence 'In most of the districts the yield was found to be relatively low but with minor differences as compared to the average yield of past years' may be replaced by –'the model slightly underestimated the yield as compared to reported yield of past year, but the deviation in 99% of villages are within 30%' 2. In place of R2 (0.68) provide the correlation	Correction Incorporated

coefficient (0.82) to show the accuracy.	Correction Incorporated
Table 12: Statistical results of yield data validation (page: 135). 1. Table legend may be changed to statistical indicators to validate model results 2. Check for NRMSE- as per my calculation it is 0.15, correct accordingly NRMSE= RMSE/(Ymax-Ymin) of observed value)	 Correction Incorporated Correction Incorporated
Section 6: Summary 1. In para 1 delete last sentence (Failing which and in presence of cloudy images the yield estimation could have been affected severely) 2. In para 3 delete first sentence (Sowing dates ranges from 305 Julian days (JDs) to 353 JDs) 3. In para 5 add 'during different crop growth period' to the first sentence 4. In para 8 provide correlation coefficient not R2 5. In para 9 correct the annexure no (3 in place of 1) 6. delete para 10 delete if not required, otherwise mention the no of villages out of total no of villages exactly those have shown >30% deviation 7. Para 11 is not required as your results showed good agreement with the collected CCEs. So delete this	 Correction Incorporated Correction Incorporated Correction Incorporated Correction Incorporated Correction Incorporated Para 10 deleted Para 10 deleted
Comment by MITR and compliance by TIP **General comment** 1. Compliance 1- replace 'Since MITR has already suggested the process flow in previous years and current year as well time to time in different meetings held online, the final outputs have been made accordingly. The accuracy and steps were followed properly. Hence there are less chances of errors. However, we have also provided the excel sheet of data having all the entries which may be used for any verifications' with - consultation was made with MITR through online discussion for major steps like planting date and Temperature stress. Next season	 Corrections incorporated

onward care will be taken to make consultation with MITR at each step of input generation for improving the accuracy 2. Compliance 2- Only give the number of pages in the final report (like No of pages were reduced to ---- in the revised report) in place of all these description- 'Now it is not possible to reduce the number of pages. Again, it is pertinent to mention here that all the inputs and outputs maps are essentially required hence clear depiction is provided for the readers by placing two to four maps per pages'.	Corrections incorporated
Satellite data 1. Compliance 1- Add one sentence that one exercise will be carried out to check the accuracy in classification with the use of full dataset in the coming season	Corrections incorporated
Methodology 1. Compliance 2- delete the portion 'However, as per YES-TECH manua' 2. Delete comment 17, as we are unable to upload the pdf with more than 10mb size	Corrections incorporated Corrections incorporated
Results 1. Comments 1- Area estimation- This is the topic title. kindly delete the serial no against this 2. Accordingly correct the numbering in the following sub titles 3. Delete comment 4 (separability analysis) 4. Compliance under comment 15 may be modified as per our discussion. You may modify the compliance as though less number of points has been taken under certain rangein the mentioned districts, but the line covers all ranges. Next year onward the number of polygons under each value range will be kept more or less same. Prior to finalization of the equation, consultation will be made with the MITR. 5. Comment 19 is for keeping the model inputs in sequence of their importance (PAR,	We feel that the numbering change will change lot in the ESR hence not done We feel that the numbering change will change lot in the ESR hence not done. Correction incorporated Correction incorporated We have tried best to arrange the report. If

FAPAR, WS , TS, RUE and HI) as suggested and these have been incorporated except for FAPAR. So change the place of FAPAR (section 5.5.3.4) and Change the compliance accordingly 6. Delete comment 21 as we are unable to upload the pdf with more than 10mb size 7. Delete comment 26	any thing remains, we will follow from next season. Apologies for this. Correction incorporated Correction incorporated
